## Creating AWS Config Managed Rules With AWS CloudFormation Templates

> **Important**
>
> You must first create and start the AWS Config configuration recorder in order to create AWS Config managed rules with AWS CloudFormation. For more information, see Managing the Configuration Recorder.

For supported AWS Config managed rules, you can use the CloudFormation templates to create the rule for your account or update an existing CloudFormation stack. A stack is a collection of related resources that you provision and update as a single unit. When you launch a stack with a template, the AWS Config managed rule is created for you. The templates create only the rule, and don't create additional AWS resources.

> **Note**
>
> When AWS Config managed rules are updated, the templates are updated for the latest changes. To save a specific version of a template for a rule, download the template, and upload it to your S3 bucket.

For more information about working with AWS CloudFormation templates, see Getting Started with AWS CloudFormation in the *AWS CloudFormation User Guide*.

**To launch an CloudFormation stack for an AWS Config managed rule**

1. Go to the CloudFormation console and create a new stack.
2. For **Specify template**:
   - If you downloaded the template, choose **Upload a template file**, and then **Choose file** to upload the template.
   - You can also choose **Amazon S3 URL**, and enter the template URL `http://s3.amazonaws.com/aws-configservice-us-east-1/cloudformation-templates-for-managed-rules/`*`THE_RULE_IDENTIFIER`*`.template`.

   > **Note**
   >
   > The rule identifier should be written in ALL_CAPS_WITH_UNDERSCORES. For example, CLOUDWATCH_LOG_GROUP_ENCRYPTED instead of cloudwatch-log-group-encrypted. For some rules, the rule identifier is different from the rule name. Make sure to use the rule identifier. For example, the rule identifier for restricted-ssh is INCOMING_SSH_DISABLED.

3. Choose **Next**.
4. For **Specify stack details**, type a stack name and enter parameter values for the AWS Config rule. For example, if you are using the `DESIRED_INSTANCE_TYPE` managed rule template, you can specify the instance type such as "m4.large".
5. Choose **Next**.
6. For **Options**, you can create tags or configure other advanced options. These are not required.
7. Choose **Next**.

8. For **Review**, verify that the template, parameters, and other options are correct.
9. Choose **Create**. The stack is created in a few minutes. You can view the created rule in the AWS Config console.

You can use the templates to create a single stack for AWS Config managed rules or update an existing stack in your account. If you delete a stack, the managed rules created from that stack are also deleted. For more information, see Working with Stacks in the *AWS CloudFormation User Guide*.

# AWS Config Custom Rules

AWS Config Custom Rules are rules that you create from scratch. There are two ways to create AWS Config custom rules: with Lambda functions (AWS Lambda Developer Guide) and with Guard (Guard GitHub Repository), a policy-as-code language.

AWS Config custom rules created with Lambda are called *AWS Config Custom Lambda Rules* and AWS Config custom rules created with Guard are called *AWS Config Custom Policy Rules*.

Before using custom rules, see Considerations.

## AWS Config Custom Policy Rules

Rules written using Guard can be created from the AWS Config console or by using the AWS Config rule APIs. AWS Config Custom Policy rules allow you to create AWS Config Custom rules without needing to use Java or Python to develop Lambda functions to manage your custom rules. AWS Config Custom Policy rules are initiated by configuration changes. For more information about Guard, see the Guard GitHub Repository.

## AWS Config Custom Lambda Rules

Custom Lambda rules provide you with the option to use Java or Python to create a Lambda function for a AWS Config Custom rule. A *Lambda function* is custom code that you upload to AWS Lambda, and it is invoked by events that are published to it by an event source. If the Lambda function is associated with an AWS Config rule, AWS Config invokes it when the rule is initiated. The Lambda function then evaluates the configuration information that is sent by AWS Config, and it returns the evaluation results. For more information about Lambda functions, see Function and Event Sources in the *AWS Lambda Developer Guide*.

# Format differences for AWS Config Custom Rules

The following table displays the format differences in the fields for the ConfigurationItem data type and for AWS Config Custom Rules.

| ConfigurationItem | AWS Config Custom Rule |
| --- | --- |
| `version` | `configurationItemVersion` |
| `accountId` | `awsAccountId` |
| `arn` | `ARN` |
| `configurationItemMD5Hash` | `configurationStateMd5Hash` |

**Topics**

- Creating AWS Config Custom Policy Rules
- Creating AWS Config Custom Lambda Rules
- Managing Deleted Resources for AWS Config Custom Lambda Rules

## Creating AWS Config Custom Policy Rules

You can create AWS Config Custom Policy rules from the AWS Management Console, AWS CLI, or AWS Config API.

### Adding AWS Config Custom Policy rules

Using the console

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the Region selector is set to an AWS Region that supports AWS Config rules. For the list of supported Regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the left navigation, choose **Rules**.
4. On the **Rules** page, choose **Add rule**.

5. On the **Specify rule type** page, choose **Create custom rule using Guard**.
6. On the **Configure rule** page, create your rule by completing the following steps:
   a. For **Rule name**, type a unique name for the rule.
   b. For **Description**, type a description for the rule.
   c. For **Guard runtime version**, choose the runtime system for your AWS Config Custom Policy rule.
   d. For **Rule Content**, you can populate it with the Guard Custom policy for your rule.
   e. For **Evaluation mode**, choose when in the resource creation and management process you want AWS Config to evaluate your resources. Depending on the rule, AWS Config can evaluate your resource configurations before a resource has been provisioned, after a resource has been provisoned, or both.
      i. Choose **Turn on proactive evaluation** to allow you to run evaluations on the configuration settings of your resources before they are deployed.

         After you have turned on proactive evaluation, you can use the StartResourceEvaluation API and GetResourceEvaluationSummary API to check if the resources you specify in these commands would be flagged as NON_COMPLIANT by the proactive rules in your account in your Region.

         For more information on using this commands, see Evaluating Your Resources with AWS Config Rules. For a list of managed rules that support proactive evaluation, see List of AWS Config Managed Rules by Evaluation Mode.
      ii. Choose **Turn on detective evaluation** to evaluate the configuration settings of your existing resources.

         For detective evaluation, AWS Config Custom Policy rules are initiated by **Configuration changes**. This option will be pre-selected.

         - **Resources** – When a resource that matches the specified resource type, or the type plus identifier, is created, changed, or deleted.
         - **Tags** – When a resource with the specified tag is created, changed, or deleted.
         - **All changes** – When a resource recorded by AWS Config is created, changed, or deleted.

AWS Config runs the evaluation when it detects a change to a resource that matches the rule's scope. You can use the scope to constrain which resources initiate evaluations. Otherwise, evaluations are initiated when there is a change to a post-provisioned resource.

f. For **Parameters**, you can customize the values for the provided keys if your rule includes parameters. A parameter is an attribute that your resources must adhere to before they are considered compliant with the rule.

7. On the **Review and create** page, review all your selections before adding the rule to your AWS account.
8. When you finish reviewing your rules, choose **Add rule**.

Using the AWS CLI

Use the `put-config-rule` command.

The `Owner` field should be `CUSTOM_POLICY`. The following additional fields are required for AWS Config Custom Policy rules:

- `Runtime`: The runtime system for your AWS Config Custom Policy rules.
- `PolicyText`: The policy definition containing the logic for your AWS Config Custom Policy rules.
- `EnableDebugLogDelivery`: The Boolean expression for enabling debug logging for your AWS Config Custom Policy rule. The default value is `false`.

Using the API Reference

Use the PutConfigRule action.

The `Owner` field should be `CUSTOM_POLICY`. The following additional fields are required for AWS Config Custom Policy rules:

- `Runtime`: The runtime system for your AWS Config Custom Policy rules.
- `PolicyText`: The policy definition containing the logic for your AWS Config Custom Policy rules.

- `EnableDebugLogDelivery`: The Boolean expression for enabling debug logging for your AWS Config Custom Policy rule. The default value is `false`.

## Writing rule content for AWS Config Custom Policy rules

With AWS Config Custom Policy rules, you can use AWS CloudFormation Guard's domain-specific language (DSL) to evaluate resource configurations. This topic provides patterns and best practices for writing custom policy rules.

For more information on how to write rules with Guard, see Writing Guard rules in the AWS CloudFormation Guard User Guide and AWS CloudFormation Guard 2.0's Modes of Operation in the Guard GitHub Repository.

### Basic rule structure

Use the following basic format to create rules:

```
# Basic rule format
rule <rule_name> when
    resourceType == "<AWS::Service::Resource>" {
    # Evaluation clauses
}

# Example with filtering
let resources_of_type = Resources.*[ Type == 'AWS::Service::Resource' ]
rule check_resources when %resources_of_type !empty {
    %resources_of_type.configuration.property == expected_value
}
```

### Key components

configuration

Contains the contents for the resource configuration.

supplementaryConfiguration

Contains additional contents for the resource configuration. AWS Config returns this field for certain resource types to supplement the information returned for the configuration field.

resourceType

AWS resource type being evaluated.

resourceId

The ID of the resource (for example, `sg-xxxxxx`).

accountId

The 12-digit AWS account ID associated with the resource.

### Common patterns

Status checks

```
let allowed_status = ['ACTIVE', 'RUNNING']
rule check_resource_status when
    resourceType == "AWS::Service::Resource" {
    configuration.status IN %allowed_status
}
```

Required properties

```
rule check_required_properties when
    resourceType == "AWS::Service::Resource" {
    configuration.propertyName exists
    configuration.propertyName is_string  # or is_list, is_struct
}
```

Query blocks

```
configuration.Properties {
    property1 exists
    property2 is_string
    property3 IN [allowed_value1, allowed_value2]
}
```

Conditional evaluation

```
when configuration.feature_enabled == true {
    configuration.feature_settings exists
    configuration.feature_settings is_struct
```

```
}
```

### Custom messages

```
rule check_compliance when
    resourceType == "AWS::Service::Resource" {
    configuration.property == expected_value <<Custom error message explaining the
 requirement>>
}}
```

## Advanced features

### Range checks

```
rule check_numeric_limits {
    # Inclusive range (lower_limit <= value <= upper_limit)
    configuration.value IN r[minimum_value, maximum_value]

    # Exclusive range (lower_limit < value < upper_limit)
    configuration.value IN r(exclusive_min, exclusive_max)

    # Left inclusive, right exclusive (lower_limit <= value < upper_limit)
    configuration.value IN r[minimum_value, exclusive_max)

    # Left exclusive, right inclusive (lower_limit < value <= upper_limit)
    configuration.value IN r(exclusive_min, maximum_value]
}
```

### Combining conditions

```
# AND conditions (implicit through new lines)
condition_1
condition_2

# OR conditions (explicit)
condition_3 OR
condition_4
```

### Chaining rules

```
rule check_prerequisites {
```

```
    configuration.required_setting exists
}

rule check_details when check_prerequisites {
    configuration.required_setting == expected_value
}
```

### Best practices

- Use variables with `let` statements for improved readability.
- Group related checks using named rule blocks.
- Include descriptive comments.
- Use appropriate operators (`exists`, `is_string`, `is_list`).
- Use regex patterns with case-insensitive matching.

### Example: dynamodb-pitr-enabled

The following example shows the policy definition for an AWS Config Custom Policy rule version of the AWS Config Managed rule dynamodb-pitr-enabled. This rule checks if DynamoDB tables have Point-in-Time Recovery enabled.

```
# Check if DynamoDB tables have Point-in-Time Recovery enabled
let status = ['ACTIVE']

rule tableisactive when
    resourceType == "AWS::DynamoDB::Table" {
    configuration.tableStatus == %status
}

rule checkcompliance when
    resourceType == "AWS::DynamoDB::Table"
    tableisactive {
    let pitr =
 supplementaryConfiguration.ContinuousBackupsDescription.pointInTimeRecoveryDescription.pointIn
    %pitr == "ENABLED" <<DynamoDB tables must have Point-in-Time Recovery enabled>>
}
```

# Creating AWS Config Custom Lambda Rules

You can develop custom rules and add them to AWS Config with AWS Lambda functions.

You associate each custom rule with an Lambda function, which contains the logic that evaluates whether your AWS resources comply with the rule. You associate this function with your rule, and the rule invokes the function either in response to configuration changes or periodically. The function then evaluates whether your resources comply with your rule, and sends its evaluation results to AWS Config.

**AWS Rule Development Kit (RDK)**

The AWS Rule Development Kit (RDK) is designed to support a "Compliance-as-Code" workflow that is intuitive and productive. It abstracts away much of the undifferentiated heavy lifting associated with deploying AWS Config rules backed by custom Lambda functions, and provides a streamlined develop-deploy-monitor iterative process.

For step-by-step instruction, see the AWS Rule Development Kit (RDK) Documentation.

**Example AWS Lambda Functions for AWS Config Rules (Node.js)**

AWS Lambda executes functions in response to events that are published by AWS services. The function for an AWS Config Custom Lambda rule receives an event that is published by AWS Config, and the function then uses data that it receives from the event and that it retrieves from the AWS Config API to evaluate the compliance of the rule. The operations in a function for a Config rule differ depending on whether it performs an evaluation that is triggered by configuration changes or triggered periodically.

For information about common patterns within AWS Lambda functions, see Programming Model in the *AWS Lambda Developer Guide*.

Example Function for Evaluations Triggered by Configuration Changes

AWS Config will invoke a function like the following example when it detects a configuration change for a resource that is within a custom rule's scope.

If you use the AWS Config console to create a rule that is associated with a function like this example, choose **Configuration changes** as the trigger type. If you use the AWS Config API or AWS CLI to create the rule, set the `MessageType` attribute to `ConfigurationItemChangeNotification` and

`OversizedConfigurationItemChangeNotification`. These settings enable your rule to be triggered whenever AWS Config generates a configuration item or an oversized configuration item as a result of a resource change.

This example evaluates your resources and checks whether the instances match the resource type, `AWS::EC2::Instance`. The rule is triggered when AWS Config generates a configuration item or an oversized configuration item notification.

```
'use strict';

import { ConfigServiceClient, GetResourceConfigHistoryCommand,
 PutEvaluationsCommand } from "@aws-sdk/client-config-service";

const configClient = new ConfigServiceClient({});

// Helper function used to validate input
function checkDefined(reference, referenceName) {
    if (!reference) {
        throw new Error(`Error: ${referenceName} is not defined`);
    }
    return reference;
}

// Check whether the message type is OversizedConfigurationItemChangeNotification,
function isOverSizedChangeNotification(messageType) {
    checkDefined(messageType, 'messageType');
    return messageType === 'OversizedConfigurationItemChangeNotification';
}

// Get the configurationItem for the resource using the getResourceConfigHistory
 API.
async function getConfiguration(resourceType, resourceId, configurationCaptureTime,
 callback) {
    const input = { resourceType, resourceId, laterTime: new
 Date(configurationCaptureTime), limit: 1 };
    const command = new GetResourceConfigHistoryCommand(input);
    await configClient.send(command).then(
        (data) => {
            callback(null, data.configurationItems[0]);
        },
        (error) => {
            callback(error, null);
        }
```

```
    );

}

// Convert the oversized configuration item from the API model to the original
 invocation model.
function convertApiConfiguration(apiConfiguration) {
    apiConfiguration.awsAccountId = apiConfiguration.accountId;
    apiConfiguration.ARN = apiConfiguration.arn;
    apiConfiguration.configurationStateMd5Hash =
 apiConfiguration.configurationItemMD5Hash;
    apiConfiguration.configurationItemVersion = apiConfiguration.version;
    apiConfiguration.configuration = JSON.parse(apiConfiguration.configuration);
    if ({}.hasOwnProperty.call(apiConfiguration, 'relationships')) {
        for (let i = 0; i < apiConfiguration.relationships.length; i++) {
            apiConfiguration.relationships[i].name =
 apiConfiguration.relationships[i].relationshipName;
        }
    }
    return apiConfiguration;
}

// Based on the message type, get the configuration item either from the
 configurationItem object in the invoking event or with the getResourceConfigHistory
 API in the getConfiguration function.

    checkDefined(ruleParameters, 'ruleParameters');

    if (configurationItem.resourceType !== 'AWS::EC2::Instance') {
        return 'NOT_APPLICABLE';
    } else if (ruleParameters.desiredInstanceType ===
 configurationItem.configuration.instanceType) {
        return 'COMPLIANT';
    }
    return 'NON_COMPLIANT';
}

// Receives the event and context from AWS Lambda.
export const handler = async (event, context) => {
    checkDefined(event, 'event');
    const invokingEvent = JSON.parse(event.invokingEvent);
    const ruleParameters = JSON.parse(event.ruleParameters);
    await getConfigurationItem(invokingEvent, async (err, configurationItem) => {

        let compliance = 'NOT_APPLICABLE';
        let annotation = '';
        const putEvaluationsRequest = {};
        if (isApplicable(configurationItem, event)) {
            // Invoke the compliance checking function.
```

```
            compliance = evaluateChangeNotificationCompliance(configurationItem,
 ruleParameters);
            if (compliance === "NON_COMPLIANT") {
                annotation = "This is an annotation describing why the resource is
 not compliant.";
            }
        }
        // Initializes the request that contains the evaluation results.
        if (annotation) {
            putEvaluationsRequest.Evaluations = [
                {
                    ComplianceResourceType: configurationItem.resourceType,
                    ComplianceResourceId: configurationItem.resourceId,
                    ComplianceType: compliance,
                    OrderingTimestamp: new
 Date(configurationItem.configurationItemCaptureTime),
                    Annotation: annotation
                },
            ];
        } else {
            putEvaluationsRequest.Evaluations = [
                {
                    ComplianceResourceType: configurationItem.resourceType,
                    ComplianceResourceId: configurationItem.resourceId,
                    ComplianceType: compliance,
                    OrderingTimestamp: new
 Date(configurationItem.configurationItemCaptureTime),
                },
            ];
        }
        putEvaluationsRequest.ResultToken = event.resultToken;

        // Sends the evaluation results to AWS Config.
        await configClient.send(new PutEvaluationsCommand(putEvaluationsRequest));
    });
};
```

### Function Operations

The function performs the following operations at runtime:

1. The function runs when AWS Lambda passes the `event` object to the `handler` function. In this example, the function accepts the optional `callback` parameter, which it uses to

return information to the caller. AWS Lambda also passes a `context` object, which contains information and methods that the function can use while it runs. Note that in newer versions of Lambda, context is no longer used.

2. The function checks whether the `messageType` for the event is a configuration item or an oversized configuration item, and then returns the configuration item.
3. The handler calls the `isApplicable` function to determine whether the resource was deleted.

> **Note**
>
> Rules reporting on deleted resources should return the evaluation result of `NOT_APPLICABLE` in order to avoid unnecessary rule evaluations.

4. The handler calls the `evaluateChangeNotificationCompliance` function and passes the `configurationItem` and `ruleParameters` objects that AWS Config published in the event.

   The function first evaluates whether the resource is an EC2 instance. If the resource is not an EC2 instance, the function returns a compliance value of `NOT_APPLICABLE`.

   The function then evaluates whether the `instanceType` attribute in the configuration item is equal to the `desiredInstanceType` parameter value. If the values are equal, the function returns `COMPLIANT`. If the values are not equal, the function returns `NON_COMPLIANT`.
5. The handler prepares to send the evaluation results to AWS Config by initializing the `putEvaluationsRequest` object. This object includes the `Evaluations` parameter, which identifies the compliance result, the resource type, and the ID of the resource that was evaluated. The `putEvaluationsRequest` object also includes the result token from the event, which identifies the rule and the event for AWS Config.
6. The handler sends the evaluation results to AWS Config by passing the object to the `putEvaluations` method of the `config` client.

## Example Function for Periodic Evaluations

AWS Config will invoke a function like the following example for periodic evaluations. Periodic evaluations occur at the frequency that you specify when you define the rule in AWS Config.

If you use the AWS Config console to create a rule that is associated with a function like this example, choose **Periodic** as the trigger type. If you use the AWS Config API or AWS CLI to create the rule, set the `MessageType` attribute to `ScheduledNotification`.

This example checks whether the total number of a specified resource exceeds a specified maximum.

```
'use strict';
import { ConfigServiceClient, ListDiscoveredResourcesCommand,
 PutEvaluationsCommand } from "@aws-sdk/client-config-service";

const configClient = new ConfigServiceClient({});

// Receives the event and context from AWS Lambda.
export const handler = async (event, context, callback) => {
    // Parses the invokingEvent and ruleParameters values, which contain JSON
 objects passed as strings.
    var invokingEvent = JSON.parse(event.invokingEvent),
        ruleParameters = JSON.parse(event.ruleParameters),
        numberOfResources = 0;

    if (isScheduledNotification(invokingEvent) &&
 hasValidRuleParameters(ruleParameters, callback)) {
        await countResourceTypes(ruleParameters.applicableResourceType, "",
 numberOfResources, async function (err, count) {
            if (err === null) {
                var putEvaluationsRequest;
                const compliance = evaluateCompliance(ruleParameters.maxCount,
 count);
                var annotation = '';
                if (compliance === "NON_COMPLIANT") {
                    annotation = "Description of why the resource is not
 compliant.";
                }
                // Initializes the request that contains the evaluation results.
                if (annotation) {
                    putEvaluationsRequest = {
                        Evaluations: [{
                            // Applies the evaluation result to the AWS account
 published in the event.
                            ComplianceResourceType: 'AWS::::Account',
                            ComplianceResourceId: event.accountId,
                            ComplianceType: compliance,
```

```
                            OrderingTimestamp: new Date(),
                            Annotation: annotation
                        }],
                        ResultToken: event.resultToken
                    };
                } else {
                    putEvaluationsRequest = {
                        Evaluations: [{
                            // Applies the evaluation result to the AWS account
 published in the event.
                            ComplianceResourceType: 'AWS::::Account',
                            ComplianceResourceId: event.accountId,
                            ComplianceType: compliance,
                            OrderingTimestamp: new Date()
                        }],
                        ResultToken: event.resultToken
                    };
                }

                // Sends the evaluation results to AWS Config.
                try {
                    await configClient.send(new
 PutEvaluationsCommand(putEvaluationsRequest));
                }
                catch (e) {
                    callback(e, null);
                }
            } else {
                callback(err, null);
            }
        });
    } else {
        console.log("Invoked for a notification other than Scheduled Notification...
 Ignoring.");
    }
};

// Checks whether the invoking event is ScheduledNotification.
function isScheduledNotification(invokingEvent) {
    return (invokingEvent.messageType === 'ScheduledNotification');
}

// Checks the rule parameters to see if they are valid
function hasValidRuleParameters(ruleParameters, callback) {
```

```
    // Regular express to verify that applicable resource given is a resource type
    const awsResourcePattern = /^AWS::(\w*)::(\w*)$/;
    const isApplicableResourceType =
 awsResourcePattern.test(ruleParameters.applicableResourceType);
    // Check to make sure the maxCount in the parameters is an integer
    const maxCountIsInt = !isNaN(ruleParameters.maxCount) &&
 parseInt(Number(ruleParameters.maxCount)) == ruleParameters.maxCount && !
isNaN(parseInt(ruleParameters.maxCount, 10));
    if (!isApplicableResourceType) {
        callback("The applicableResourceType parameter is not a valid resource
 type.", null);
    }
    if (!maxCountIsInt) {
        callback("The maxCount parameter is not a valid integer.", null);
    }
    return isApplicableResourceType && maxCountIsInt;
}

// Checks whether the compliance conditions for the rule are violated.
function evaluateCompliance(maxCount, actualCount) {
    if (actualCount > maxCount) {
        return "NON_COMPLIANT";
    } else {
        return "COMPLIANT";
    }
}

// Counts the applicable resources that belong to the AWS account.
async function countResourceTypes(applicableResourceType, nextToken, count,
 callback) {
    const input = { resourceType: applicableResourceType, nextToken: nextToken };
    const command = new ListDiscoveredResourcesCommand(input);
    try {
        const response = await configClient.send(command);
        count = count + response.resourceIdentifiers.length;
        if (response.nextToken !== undefined && response.nextToken != null) {
            countResourceTypes(applicableResourceType, response.nextToken, count,
 callback);
        }
        callback(null, count);
    } catch (e) {
        callback(e, null);
    }
    return count;
```

```
}
```

### Function Operations

The function performs the following operations at runtime:

1. The function runs when AWS Lambda passes the `event` object to the `handler` function. In this example, the function accepts the optional `callback` parameter, which it uses to return information to the caller. AWS Lambda also passes a `context` object, which contains information and methods that the function can use while it runs. Note that in newer versions of Lambda, context is no longer used.
2. To count the resources of the specified type, the handler calls the `countResourceTypes` function, and it passes the `applicableResourceType` parameter that it received from the event. The `countResourceTypes` function calls the `listDiscoveredResources` method of the `config` client, which returns a list of identifiers for the applicable resources. The function uses the length of this list to determine the number of applicable resources, and it returns this count to the handler.
3. The handler prepares to send the evaluation results to AWS Config by initializing the `putEvaluationsRequest` object. This object includes the `Evaluations` parameter, which identifies the compliance result and the AWS account that was published in the event. You can use the `Evaluations` parameter to apply the result to any resource type that is supported by AWS Config. The `putEvaluationsRequest` object also includes the result token from the event, which identifies the rule and the event for AWS Config.
4. Within the `putEvaluationsRequest` object, the handler calls the `evaluateCompliance` function. This function tests whether the number of applicable resources exceeds the maximum assigned to the `maxCount` parameter, which was provided by the event. If the number of resources exceeds the maximum, the function returns `NON_COMPLIANT`. If the number of resources does not exceed the maximum, the function returns `COMPLIANT`.
5. The handler sends the evaluation results to AWS Config by passing the object to the `putEvaluations` method of the `config` client.

## Example AWS Lambda Functions for AWS Config Rules (Python)

AWS Lambda executes functions in response to events that are published by AWS services. The function for an AWS Config Custom Lambda rule receives an event that is published by AWS Config, and the function then uses data that it receives from the event and that it retrieves from the AWS Config API to evaluate the compliance of the rule. The operations in a function

for a Config rule differ depending on whether it performs an evaluation that is triggered by configuration changes or triggered periodically.

For information about common patterns within AWS Lambda functions, see Programming Model in the *AWS Lambda Developer Guide*.

Example Function for Evaluations Triggered by Configuration Changes

AWS Config will invoke a function like the following example when it detects a configuration change for a resource that is within a custom rule's scope.

If you use the AWS Config console to create a rule that is associated with a function like this example, choose **Configuration changes** as the trigger type. If you use the AWS Config API or AWS CLI to create the rule, set the `MessageType` attribute to `ConfigurationItemChangeNotification` and `OversizedConfigurationItemChangeNotification`. These settings enable your rule to be triggered whenever AWS Config generates a configuration item or an oversized configuration item as a result of a resource change.

```
import botocore
import boto3
import json
import datetime

# Set to True to get the lambda to assume the Role attached on the Config Service
 (useful for cross-account).
ASSUME_ROLE_MODE = False

# This gets the client after assuming the Config service role
# either in the same AWS account or cross-account.
def get_client(service, event):
    """Return the service boto client. It should be used instead of directly calling
 the client.
    Keyword arguments:
    service -- the service name used for calling the boto.client()
    event -- the event variable given in the lambda handler
    """
    if not ASSUME_ROLE_MODE:
        return boto3.client(service)
    credentials = get_assume_role_credentials(event["executionRoleArn"])
    return boto3.client(service, aws_access_key_id=credentials['AccessKeyId'],
                        aws_secret_access_key=credentials['SecretAccessKey'],
```

```
                        aws_session_token=credentials['SessionToken']
                       )

### Function Operations

The function performs the following operations at runtime:

1. The function runs when AWS Lambda passes the `event` object to the `handler` function. In this example, the function accepts the optional `callback` parameter, which it uses to return information to the caller. AWS Lambda also passes a `context` object, which contains information and methods that the function can use while it runs. Note that in newer versions of Lambda, context is no longer used.
2. The function checks whether the `messageType` for the event is a configuration item or an oversized configuration item, and then returns the configuration item.
3. The handler calls the `isApplicable` function to determine whether the resource was deleted.

   > **Note**
   >
   > Rules reporting on deleted resources should return the evaluation result of `NOT_APPLICABLE` in order to avoid unnecessary rule evaluations.

4. The handler calls the `evaluateChangeNotificationCompliance` function and passes the `configurationItem` and `ruleParameters` objects that AWS Config published in the event.

   The function first evaluates whether the resource is an EC2 instance. If the resource is not an EC2 instance, the function returns a compliance value of `NOT_APPLICABLE`.

   The function then evaluates whether the `instanceType` attribute in the configuration item is equal to the `desiredInstanceType` parameter value. If the values are equal, the function returns `COMPLIANT`. If the values are not equal, the function returns `NON_COMPLIANT`.
5. The handler prepares to send the evaluation results to AWS Config by initializing the `putEvaluationsRequest` object. This object includes the `Evaluations` parameter, which identifies the compliance result, the resource type, and the ID of the resource that was evaluated. The `putEvaluationsRequest` object also includes the result token from the event, which identifies the rule and the event for AWS Config.

6. The handler sends the evaluation results to AWS Config by passing the object to the `putEvaluations` method of the `config` client.

## Example Function for Periodic Evaluations

AWS Config will invoke a function like the following example for periodic evaluations. Periodic evaluations occur at the frequency that you specify when you define the rule in AWS Config.

If you use the AWS Config console to create a rule that is associated with a function like this example, choose **Periodic** as the trigger type. If you use the AWS Config API or AWS CLI to create the rule, set the `MessageType` attribute to `ScheduledNotification`.

```
import botocore
import boto3
import json
import datetime

# Set to True to get the lambda to assume the Role attached on the Config Service
 (useful for cross-account).
ASSUME_ROLE_MODE = False
DEFAULT_RESOURCE_TYPE = 'AWS::::Account'

# This gets the client after assuming the Config service role
# either in the same AWS account or cross-account.
def get_client(service, event):
    """Return the service boto client. It should be used instead of directly calling
 the client.
    Keyword arguments:
    service -- the service name used for calling the boto.client()
    event -- the event variable given in the lambda handler
    """
    if not ASSUME_ROLE_MODE:
        return boto3.client(service)
    credentials = get_assume_role_credentials(event["executionRoleArn"])
    return boto3.client(service, aws_access_key_id=credentials['AccessKeyId'],
                        aws_secret_access_key=credentials['SecretAccessKey'],
                        aws_session_token=credentials['SessionToken']
                       )

def get_assume_role_credentials(role_arn):
    sts_client = boto3.client('sts')
    try:
```

```
        assume_role_response = sts_client.assume_role(RoleArn=role_arn,
 RoleSessionName="configLambdaExecution")
        return assume_role_response['Credentials']
    except botocore.exceptions.ClientError as ex:
        # Scrub error message for any internal account info leaks
        if 'AccessDenied' in ex.response['Error']['Code']:
            ex.response['Error']['Message'] = "AWS Config does not have permission
 to assume the IAM role."
        else:
            ex.response['Error']['Message'] = "InternalError"
            ex.response['Error']['Code'] = "InternalError"
        raise ex

# Check whether the message is a ScheduledNotification or not.
def is_scheduled_notification(message_type):
    return message_type == 'ScheduledNotification'

def count_resource_types(applicable_resource_type, next_token, count):
    resource_identifier =
 AWS_CONFIG_CLIENT.list_discovered_resources(resourceType=applicable_resource_type,
 nextToken=next_token)
    updated = count + len(resource_identifier['resourceIdentifiers']);
    return updated

# Evaluates the configuration items in the snapshot and returns the compliance value
 to the handler.
def evaluate_compliance(max_count, actual_count):
    return 'NON_COMPLIANT' if int(actual_count) > int(max_count) else 'COMPLIANT'

def evaluate_parameters(rule_parameters):
    if 'applicableResourceType' not in rule_parameters:
        raise ValueError('The parameter with "applicableResourceType" as key must be
 defined.')
    if not rule_parameters['applicableResourceType']:
        raise ValueError('The parameter "applicableResourceType" must have a defined
 value.')
    return rule_parameters

# This generate an evaluation for config
def build_evaluation(resource_id, compliance_type, event,
 resource_type=DEFAULT_RESOURCE_TYPE, annotation=None):
    """Form an evaluation as a dictionary. Usually suited to report on scheduled
 rules.
    Keyword arguments:
```

```
    resource_id -- the unique id of the resource to report
    compliance_type -- either COMPLIANT, NON_COMPLIANT or NOT_APPLICABLE
    event -- the event variable given in the lambda handler
    resource_type -- the CloudFormation resource type (or AWS::::Account) to report
 on the rule (default DEFAULT_RESOURCE_TYPE)
    annotation -- an annotation to be added to the evaluation (default None)
    """
    eval_cc = {}
    if annotation:
        eval_cc['Annotation'] = annotation
    eval_cc['ComplianceResourceType'] = resource_type
    eval_cc['ComplianceResourceId'] = resource_id
    eval_cc['ComplianceType'] = compliance_type
    eval_cc['OrderingTimestamp'] = str(json.loads(event['invokingEvent'])
['notificationCreationTime'])
    return eval_cc

def lambda_handler(event, context):

    global AWS_CONFIG_CLIENT

    evaluations = []
    rule_parameters = {}
    resource_count = 0
    max_count = 0

    invoking_event = json.loads(event['invokingEvent'])
    if 'ruleParameters' in event:
        rule_parameters = json.loads(event['ruleParameters'])
        valid_rule_parameters = evaluate_parameters(rule_parameters)

    compliance_value = 'NOT_APPLICABLE'

    AWS_CONFIG_CLIENT = get_client('config', event)
    if is_scheduled_notification(invoking_event['messageType']):
        result_resource_count =
 count_resource_types(valid_rule_parameters['applicableResourceType'], '',
 resource_count)

    if valid_rule_parameters.get('maxCount'):
        max_count = valid_rule_parameters['maxCount']

    compliance_value = evaluate_compliance(max_count, result_resource_count)
```

```
    evaluations.append(build_evaluation(event['accountId'], compliance_value, event,
resource_type=DEFAULT_RESOURCE_TYPE))
    response = AWS_CONFIG_CLIENT.put_evaluations(Evaluations=evaluations,
ResultToken=event['resultToken'])
```

### Function Operations

The function performs the following operations at runtime:

1. The function runs when AWS Lambda passes the `event` object to the `handler` function. In this example, the function accepts the optional `callback` parameter, which it uses to return information to the caller. AWS Lambda also passes a `context` object, which contains information and methods that the function can use while it runs. Note that in newer versions of Lambda, context is no longer used.
2. To count the resources of the specified type, the handler calls the `countResourceTypes` function, and it passes the `applicableResourceType` parameter that it received from the event. The `countResourceTypes` function calls the `listDiscoveredResources` method of the `config` client, which returns a list of identifiers for the applicable resources. The function uses the length of this list to determine the number of applicable resources, and it returns this count to the handler.
3. The handler prepares to send the evaluation results to AWS Config by initializing the `putEvaluationsRequest` object. This object includes the `Evaluations` parameter, which identifies the compliance result and the AWS account that was published in the event. You can use the `Evaluations` parameter to apply the result to any resource type that is supported by AWS Config. The `putEvaluationsRequest` object also includes the result token from the event, which identifies the rule and the event for AWS Config.
4. Within the `putEvaluationsRequest` object, the handler calls the `evaluateCompliance` function. This function tests whether the number of applicable resources exceeds the maximum assigned to the `maxCount` parameter, which was provided by the event. If the number of resources exceeds the maximum, the function returns `NON_COMPLIANT`. If the number of resources does not exceed the maximum, the function returns `COMPLIANT`.
5. The handler sends the evaluation results to AWS Config by passing the object to the `putEvaluations` method of the `config` client.

### Example Events for AWS Config Rules

When the trigger for a rule occurs, AWS Config invokes the rule's AWS Lambda function by publishing an event. Then AWS Lambda executes the function by passing the event to the function's handler.

Example Event for Evaluations Triggered by Configuration Changes

AWS Config publishes an event when it detects a configuration change for a resource that is within a rule's scope. The following example event shows that the rule was triggered by a configuration change for an EC2 instance.

```
{
    "invokingEvent": "{\"configurationItem\":{\"configurationItemCaptureTime
\":\"2016-02-17T01:36:34.043Z\",\"awsAccountId\":\"123456789012\",
\"configurationItemStatus\":\"OK\",\"resourceId\":\"i-00000000\",\"ARN
\":\"arn:aws:ec2:us-east-2:123456789012:instance/i-00000000\",\"awsRegion
\":\"us-east-2\",\"availabilityZone\":\"us-east-2a\",\"resourceType\":
\"AWS::EC2::Instance\",\"tags\":{\"Foo\":\"Bar\"},\"relationships\":[{\"resourceId
\":\"eipalloc-00000000\",\"resourceType\":\"AWS::EC2::EIP\",\"name\":\"Is
 attached to ElasticIp\"}],\"configuration\":{\"foo\":\"bar\"}},\"messageType\":
\"ConfigurationItemChangeNotification\"}",
    "ruleParameters": "{\"myParameterKey\":\"myParameterValue\"}",
    "resultToken": "myResultToken",
    "eventLeftScope": false,
    "executionRoleArn": "arn:aws:iam::123456789012:role/config-role",
    "configRuleArn": "arn:aws:config:us-east-2:123456789012:config-rule/config-
rule-0123456",
    "configRuleName": "change-triggered-config-rule",
    "configRuleId": "config-rule-0123456",
    "accountId": "123456789012",
    "version": "1.0"
}
```

Example Event for Evaluations Triggered by Oversized Configuration Changes

Some resource changes generate oversized configuration items. The following example event shows that the rule was triggered by an oversized configuration change for an EC2 instance.

```
{
        "invokingEvent": "{\"configurationItemSummary\": {\"changeType\":
 \"UPDATE\",\"configurationItemVersion\": \"1.2\",\"configurationItemCaptureTime
```

```
\":\"2016-10-06T16:46:16.261Z\",\"configurationStateId\": 0,\"awsAccountId
\":\"123456789012\",\"configurationItemStatus\": \"OK\",\"resourceType
\": \"AWS::EC2::Instance\",\"resourceId\":\"i-00000000\",\"resourceName
\":null,\"ARN\":\"arn:aws:ec2:us-west-2:123456789012:instance/i-00000000\",
\"awsRegion\": \"us-west-2\",\"availabilityZone\":\"us-west-2a\",
\"configurationStateMd5Hash\":\"8f1ee69b287895a0f8bc5753eca68e96\",
\"resourceCreationTime\":\"2016-10-06T16:46:10.489Z\"},\"messageType\":
\"OversizedConfigurationItemChangeNotification\"}",
        "ruleParameters": "{\"myParameterKey\":\"myParameterValue\"}",
        "resultToken": "myResultToken",
        "eventLeftScope": false,
        "executionRoleArn": "arn:aws:iam::123456789012:role/config-role",
        "configRuleArn": "arn:aws:config:us-east-2:123456789012:config-rule/config-
rule-ec2-managed-instance-inventory",
        "configRuleName": "change-triggered-config-rule",
        "configRuleId": "config-rule-0123456",
        "accountId": "123456789012",
        "version": "1.0"
    }
```

Example Event for Evaluations Triggered by Periodic Frequency

AWS Config publishes an event when it evaluates your resources at a frequency that you specify (such as every 24 hours). The following example event shows that the rule was triggered by a periodic frequency.

```
{
    "invokingEvent": "{\"awsAccountId\":\"123456789012\",\"notificationCreationTime
\":\"2016-07-13T21:50:00.373Z\",\"messageType\":\"ScheduledNotification\",
\"recordVersion\":\"1.0\"}",
    "ruleParameters": "{\"myParameterKey\":\"myParameterValue\"}",
    "resultToken": "myResultToken",
    "eventLeftScope": false,
    "executionRoleArn": "arn:aws:iam::123456789012:role/config-role",
    "configRuleArn": "arn:aws:config:us-east-2:123456789012:config-rule/config-
rule-0123456",
    "configRuleName": "periodic-config-rule",
    "configRuleId": "config-rule-6543210",
    "accountId": "123456789012",
    "version": "1.0"
}
```

### Event Attributes

The JSON object for an AWS Config event contains the following attributes:

`invokingEvent`

The event that triggers the evaluation for a rule. If the event is published in response to a resource configuration change, the value for this attribute is a string that contains a JSON `configurationItem` or a `configurationItemSummary` (for oversized configuration items). The configuration item represents the state of the resource at the moment that AWS Config detected the change. For an example of a configuration item, see the output produced by the `get-resource-config-history` AWS CLI command in Viewing Configuration History.

If the event is published for a periodic evaluation, the value is a string that contains a JSON object. The object includes information about the evaluation that was triggered.

For each type of event, a function must parse the string with a JSON parser to be able to evaluate its contents, as shown in the following Node.js example:

```
var invokingEvent = JSON.parse(event.invokingEvent);
```

`ruleParameters`

Key/value pairs that the function processes as part of its evaluation logic. You define parameters when you use the AWS Config console to create a Custom Lambda rule. You can also define parameters with the `InputParameters` attribute in the `PutConfigRule` AWS Config API request or the `put-config-rule` AWS CLI command.

The JSON code for the parameters is contained within a string, so a function must parse the string with a JSON parser to be able to evaluate its contents, as shown in the following Node.js example:

```
var ruleParameters = JSON.parse(event.ruleParameters);
```

`resultToken`

A token that the function must pass to AWS Config with the `PutEvaluations` call.

`eventLeftScope`

A Boolean value that indicates whether the AWS resource to be evaluated has been removed from the rule's scope. If the value is `true`, the function indicates that the evaluation can be

ignored by passing `NOT_APPLICABLE` as the value for the `ComplianceType` attribute in the `PutEvaluations` call.

`executionRoleArn`

The ARN of the IAM role that is assigned to AWS Config.

`configRuleArn`

The ARN that AWS Config assigned to the rule.

`configRuleName`

The name that you assigned to the rule that caused AWS Config to publish the event and invoke the function.

`configRuleId`

The ID that AWS Config assigned to the rule.

`accountId`

The ID of the AWS account that owns the rule.

`version`

A version number assigned by AWS. The version will increment if AWS adds attributes to AWS Config events. If a function requires an attribute that is only in events that match or exceed a specific version, then that function can check the value of this attribute.

The current version for AWS Config events is 1.0.

## Managing Deleted Resources for AWS Config Custom Lambda Rules

Rules reporting on deleted resources should return the evaluation result of `NOT_APPLICABLE` in order to avoid unnecessary rule evaluations.

When you delete a resource, AWS Config creates a `configurationItem` with `ResourceDeleted` for the `configurationItemStatus`. You can use this metadata to check if a rule reports on a deleted resource. For more information on configuration items, see Concepts | Configuration Items.

Include the following code snippets to check for deleted resources and set the evaluation result of an AWS Config custom lambda rule to `NOT_APPLICABLE` if it reports on a deleted resource:

### Custom Lambda Rules (Node.js)

```
// Check whether the resource has been deleted. If the resource was deleted, then
 the evaluation returns not applicable.
function isApplicable(configurationItem, event) {
    checkDefined(configurationItem, 'configurationItem');
    checkDefined(event, 'event');
    const status = configurationItem.configurationItemStatus;
    const eventLeftScope = event.eventLeftScope;
    return (status === 'OK' || status === 'ResourceDiscovered') && eventLeftScope
 === false;
}
```

### Custom Lambda Rules (Python)

```
# Check whether the resource has been deleted. If the resource was deleted, then the
 evaluation returns not applicable.
def is_applicable(configurationItem, event):
    try:
        check_defined(configurationItem, 'configurationItem')
        check_defined(event, 'event')
    except:
        return True
    status = configurationItem['configurationItemStatus']
    eventLeftScope = event['eventLeftScope']
    if status == 'ResourceDeleted':
        print("Resource Deleted, setting Compliance Status to NOT_APPLICABLE.")
    return (status == 'OK' or status == 'ResourceDiscovered') and not eventLeftScope
```

> **Note**
>
> AWS Config managed rules and AWS Config custom policy rules handle this behavior by default.
>
> If you create an AWS Config custom lambd rule with Python using the AWS Config Development Kit (RDK) and AWS Config Development Kit Library (RDKlib), the imported Evaluator class will check this behavior. For information on how to write rules with the RDK and RDKlib, see Writing rules with the RDK and RDKlib.

# Service-Linked AWS Config Rules

A service-linked AWS Config rule is a unique type of AWS Config managed rules that supports other AWS services to create AWS Config rules in your account. Service-linked rules are predefined to include all the permissions required to call other AWS services on your behalf. These rules are similar to standards that an AWS service recommends in your AWS account for compliance verification.

These service-linked AWS Config rules are owned by AWS service teams. The AWS service team creates these rules in your AWS account. You have read-only access to these rules. You cannot edit or delete these rules if you are subscribed to AWS service that these rules are linked to.

**Service-linked rules and the AWS Command Line Interface**

With the AWS CLI, the PutConfigRule, DeleteConfigRule, and DeleteEvaluationResults APIs return access denied with the following error message:

```
INSUFFICIENT_SLCR_PERMISSIONS = "An AWS service owns
ServiceLinkedConfigRule. You do not have permissions to take action on this
rule."
```

**Service-linked rules and the AWS Config console**

In the AWS Config console, the service-linked AWS Config rules are visible in the **Rules** page. The **Edit** and **Delete results** buttons are greyed in the console to restrict you from editing the rule. You can view details of the rule by choosing the rule.

**Service-linked rules, remediation actions, and conformance packs**

To add remediation actions to a service-linked rules in a conformance pack, you need to add the remediation action to the conformance pack template itself, and then update the conformance pack with your updated template. For information on updating conformance packs, see Deploying a Conformance Pack (Console), Deploying a Conformance Pack (AWS CLI) and Managing Organizational Conformance Packs.

**Editing and deleting service-linked rules**

To edit or delete a service-linked rule, contact the AWS service that created the rule. For example, for service-linked rules created by AWS Security Hub CSPM, you can remove a service-linked rule by following these steps in the *AWS Security Hub CSPM User Guide*: Disabling a security standard.

# Managing AWS Config Rules Across All Accounts in Your Organization

> **Important**
>
> Organizational rules can only be created using the API or CLI. This operation is not supported in the AWS Config console.

AWS Config allows you to manage AWS Config rules across all AWS accounts within an organization. You can:

- Centrally create, update, and delete AWS Config rules across all accounts in your organization.
- Deploy a common set of AWS Config rules across all accounts and specify accounts where AWS Config rules should not be created.
- Use the APIs from the management account in AWS Organizations to enforce governance by ensuring that the underlying AWS Config rules are not modifiable by your organization's member accounts.

## Considerations

### For deployments across different regions

The API call to deploy rules and conformance packs across accounts is AWS Region specific. At the organization level, you need to change the context of your API call to a different region if you want to deploy rules in other regions. For example, to deploy a rule in US East (N. Virginia), change the region to US East (N. Virginia) and then call `PutOrganizationConfigRule`.

### For accounts within an organization

If a new account joins an organization, the rule or conformance pack is deployed to that account. When an account leaves an organization, the rule or conformance pack is removed.

If you deploy an organizational rule or conformance pack in an organization administrator account, and then establish a delegated administrator and deploy an organizational rule or conformance pack in the delegated administrator account, you won't be able to see the organizational rule or conformance pack in the organization administrator account from the delegated administrator

account or see the organizational rule or conformance pack in the delegated administrator account from organization administrator account. The DescribeOrganizationConfigRules and DescribeOrganizationConformancePacks APIs can only see and interact with the organization-related resource that were deployed from within the account calling those APIs.

**Retry mechanism for new accounts added to an organization**

Deployment of existing organizational rules and conformance packs will only be retried for 7 hours after an account is added to your organization if a recorder is not available. You are expected to create a recorder if one doesn't exist within 7 hours of adding an account to your organization.

**Organization management accounts, delegated administrators, and service-linked roles**

If you are using an organization management account and intend to use a delegated administrator for organizational deployment, be aware that AWS Config won't automatically create the service-linked role (SLR). You must manually create the service-linked role (SLR) separately using IAM.

If you do not have an SLR for your management account, you will not be able to deploy resources to that account from a delegated administrator account. You will still be able to deploy AWS Config rules to member accounts from management and delegated administrator accounts. For more information, see Using service-linked roles in the *AWS Identity and Access Management (IAM) User Guide*.

## Deployment

For information on how to integrate AWS Config with AWS Organizations, see AWS Config and AWS Organizations in the *AWS Organizations User Guide*. Ensure AWS Config recording is on before you use the following APIs to manage AWS Config rules across all AWS accounts within an organization:

- PutOrganizationConfigRule, adds or updates organization config rule for your entire organization evaluating whether your AWS resources comply with your desired configurations.
- DescribeOrganizationConfigRules, returns a list of organization config rules.
- GetOrganizationConfigRuleDetailedStatus, returns detailed status for each member account within an organization for a given organization config rule.
- GetOrganizationCustomRulePolicy, returns the policy definition containing the logic for your organization config custom policy rule.
- DescribeOrganizationConfigRuleStatuses, provides organization config rule deployment status for an organization.

- DeleteOrganizationConfigRule, deletes the specified organization config rule and all of its evaluation results from all member accounts in that organization.

## Region Support

Deploying AWS Config Rules across member accounts in an AWS Organization is supported in the following Regions.

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| US East (Ohio) | us-east-2 | config.us-east-2.amazonaws.com | HTTPS |
| US East (N. Virginia) | us-east-1 | config.us-east-1.amazonaws.com | HTTPS |
| US West (N. California) | us-west-1 | config.us-west-1.amazonaws.com | HTTPS |
| US West (Oregon) | us-west-2 | config.us-west-2.amazonaws.com | HTTPS |
| Africa (Cape Town) | af-south-1 | config.af-south-1.amazonaws.com | HTTPS |
| Asia Pacific (Hong Kong) | ap-east-1 | config.ap-east-1.amazonaws.com | HTTPS |
| Asia Pacific | ap-south-2 | config.ap-south-2.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol | |
|---|---|---|---|---|
| (Hyderabad) | | | | |
| Asia Pacific (Jakarta) | ap-southeast-3 | config.ap-southeast-3.amazonaws.com | HTTPS | |
| Asia Pacific (Malaysia) | ap-southeast-5 | config.ap-southeast-5.amazonaws.com | HTTPS | |
| Asia Pacific (Melbourne) | ap-southeast-4 | config.ap-southeast-4.amazonaws.com | HTTPS | |
| Asia Pacific (Mumbai) | ap-south-1 | config.ap-south-1.amazonaws.com | HTTPS | |
| Asia Pacific (New Zealand) | ap-southeast-6 | config.ap-southeast-6.amazonaws.com | HTTPS | |
| Asia Pacific (Osaka) | ap-northeast-3 | config.ap-northeast-3.amazonaws.com | HTTPS | |
| Asia Pacific (Seoul) | ap-northeast-2 | config.ap-northeast-2.amazonaws.com | HTTPS | |

| Region Name | Region | Endpoint | Protocol | |
|---|---|---|---|---|
| Asia Pacific (Singapore) | ap-southeast-1 | config.ap-southeast-1.amazonaws.com | HTTPS | |
| Asia Pacific (Sydney) | ap-southeast-2 | config.ap-southeast-2.amazonaws.com | HTTPS | |
| Asia Pacific (Taipei) | ap-east-2 | config.ap-east-2.amazonaws.com | HTTPS | |
| Asia Pacific (Thailand) | ap-southeast-7 | config.ap-southeast-7.amazonaws.com | HTTPS | |
| Asia Pacific (Tokyo) | ap-northeast-1 | config.ap-northeast-1.amazonaws.com | HTTPS | |
| Canada (Central) | ca-central-1 | config.ca-central-1.amazonaws.com | HTTPS | |
| Canada West (Calgary) | ca-west-1 | config.ca-west-1.amazonaws.com | HTTPS | |
| Europe (Frankfurt) | eu-central-1 | config.eu-central-1.amazonaws.com | HTTPS | |
| Europe (Ireland) | eu-west-1 | config.eu-west-1.amazonaws.com | HTTPS | |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| Europe (London) | eu-west-2 | config.eu-west-2.amazonaws.com | HTTPS |
| Europe (Milan) | eu-south-1 | config.eu-south-1.amazonaws.com | HTTPS |
| Europe (Paris) | eu-west-3 | config.eu-west-3.amazonaws.com | HTTPS |
| Europe (Spain) | eu-south-2 | config.eu-south-2.amazonaws.com | HTTPS |
| Europe (Stockholm) | eu-north-1 | config.eu-north-1.amazonaws.com | HTTPS |
| Europe (Zurich) | eu-central-2 | config.eu-central-2.amazonaws.com | HTTPS |
| Israel (Tel Aviv) | il-central-1 | config.il-central-1.amazonaws.com | HTTPS |
| Mexico (Central) | mx-central-1 | config.mx-central-1.amazonaws.com | HTTPS |

| Middle East (UAE) | me-central-1 | config.me-central-1.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| South America (São Paulo) | sa-east-1 | config.sa-east-1.amazonaws.com | HTTPS |
| AWS GovCloud (US-East) | us-gov-east-1 | config.us-gov-east-1.amazonaws.com | HTTPS |
| AWS GovCloud (US-West) | us-gov-west-1 | config.us-gov-west-1.amazonaws.com | HTTPS |

# Adding AWS Config Rules

You can use the AWS Config console or the AWS SDKs to add rules.

**Topics**

- Adding Rules (Console)
- Adding Rules (AWS SDKs)

## Adding Rules (Console)

The **Rules** page shows your rules and their current compliance results in a table. The result for each rule is **Evaluating...** until AWS Config finishes evaluating your resources against the rule. You can update the results with the refresh button. When AWS Config finishes evaluations, you can see the rules and resource types that are compliant or noncompliant. For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config.

> **Note**
>
> When you add a new rule, AWS Config evaluates the applicable resources in your resource inventory, including previously recorded resources. For example, if you recorded

`AWS::IoT::Policy` resources but later excluded them from recording, AWS Config retains the initial configuration items (CIs) in your inventory. Although AWS Config no longer updates these CIs when their associated resource types are excluded from recording, it retains their last recorded state and evaluates them when you add applicable rules.
AWS Config does not evaluate resources that are not in the resource inventory. For example, if you add the amplify-branch-tagged rule but don't record and have never recorded `AWS::Amplify::Branch` resources, AWS Config can't evaluate whether the AWS Amplify branches in your account are compliant or noncompliant.
For more information, see Recording AWS Resources with AWS Config.

### Adding rules

#### To add a rule

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the left navigation, choose **Rules**.
4. On the **Rules** page, choose **Add rule**.
5. On the **Specify rule type** page, specify the rule type by completing the following steps:
   a. Type in the search field to filter the list of managed rules by rule name, description, and label. For example, type **EC2** to return rules that evaluate EC2 resource types or type **periodic** to return rules that are triggered periodically.
   b. You can also create your own custom rule. Choose **Create custom rule using Lambda** or **Create custom rule using Guard**, and follow the procedure in Creating AWS Config Custom Lambda Rules or Creating AWS Config Custom Policy Rules.
6. On the **Configure rule** page, configure your rule by completing the following steps:
   a. For **Name**, type a unique name for the rule.
   b. For **Description**, type a description for the rule.
   c. For **Evaluation mode**, choose when in the resource creation and management process you want AWS Config to evaluate your resources. Depending on the rule, AWS Config

can evaluate your resource configurations before a resource has been deployed, after a resource has been deployed, or both.

i. Choose **Turn on proactive evaluation** to allow you to run evaluations on the configuration settings of your resources before they are deployed.

   After you have turned on proactive evaluation, you can use the StartResourceEvaluation API and GetResourceEvaluationSummary API to check if the resources you specify in these commands would be flagged as NON_COMPLIANT by the proactive rules in your account in your Region.

   For more information on using this commands, see Evaluating Your Resources with AWS Config Rules. For a list of managed rules that support proactive evaluation, see List of AWS Config Managed Rules by Evaluation Mode.

ii. Choose **Turn on detective evaluation** to evaluate the configuration settings of your existing resources.

   For detective evaluation, there are two types of triggers: **When configuration changes** and **Periodic**.

   A. If the trigger types for your rule include **Configuration changes**, specify one of the following options for **Scope of changes** with which AWS Config invokes your Lambda function:

      - **Resources** – When a resource that matches the specified resource type, or the type plus identifier, is created, changed, or deleted.
      - **Tags** – When a resource with the specified tag is created, changed, or deleted.
      - **All changes** – When a resource recorded by AWS Config is created, changed, or deleted.

      AWS Config runs the evaluation when it detects a change to a resource that matches the rule's scope. You can use the scope to define which resources initiate evaluations.

   B. If the trigger types for your rule include **Periodic**, specify the **Frequency** with which AWS Config invokes your Lambda function.

d. For **Parameters**, you can customize the values for the provided keys if your rule includes parameters. A parameter is an attribute that your resources must adhere to before they are considered compliant with the rule.

7. On the **Review and create** page, review all your selections before adding the rule to your AWS account. If your rule is not working as expected, you might see one of the following for **Compliance**:

   - **No results reported** - AWS Config evaluated your resources against the rule. The rule did not apply to the AWS resources in its scope, the specified resources were deleted, or the evaluation results were deleted. To get evaluation results, update the rule, change its scope, or choose **Re-evaluate**.

     This message may also appear if the rule didn't report evaluation results.
   - **No resources in scope** - AWS Config cannot evaluate your recorded AWS resources against this rule because none of your resources are within the rule's scope. To get evaluation results, edit the rule and change its scope, or add resources for AWS Config to record by using the **Settings** page.
   - **Evaluations failed** - For information that can help you determine the problem, choose the rule name to open its details page and see the error message.

## Adding Rules (AWS SDKs)

### Adding rules

The following code examples show how to use `PutConfigRule`.

CLI

**AWS CLI**

**Example 1: To add an AWS managed Config rule**

The following `put-config-rule` example provides JSON code to add an AWS managed Config rule.

```
aws configservice put-config-rule \
    --config-rule file://RequiredTagsForEC2Instances.json
```

`RequiredTagsForEC2Instances.json` is a JSON file that contains the rule configuration.

Contents of `RequiredTagsForEC2Instances.json`:

```
{
    "ConfigRuleName": "RequiredTagsForEC2Instances",
    "Description": "Checks whether the CostCenter and Owner tags are applied to
 EC2 instances.",
    "Scope": {
        "ComplianceResourceTypes": [
            "AWS::EC2::Instance"
        ]
    },
    "Source": {
        "Owner": "AWS",
        "SourceIdentifier": "REQUIRED_TAGS"
    },
    "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because the rule is a managed rule, the `Owner` attribute is set to `AWS`, and the `SourceIdentifier` attribute is set to the rule identifier, `REQUIRED_TAGS`. For the `InputParameters` attribute, the tag keys that the rule requires, `CostCenter` and `Owner`, are specified.

This command produces no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

For more information, see AWS Config Managed Rules in the *AWS Config Developer Guide*.

**Example 2: To add a customer managed Config rule**

The following `put-config-rule` example provides JSON code to add a customer managed Config rule.

```
aws configservice put-config-rule \
    --config-rule file://InstanceTypesAreT2micro.json
```

`InstanceTypesAreT2micro.json` is a JSON file that contains the rule configuration.

Contents of `InstanceTypesAreT2micro.json`:

```
{
    "ConfigRuleName": "InstanceTypesAreT2micro",
    "Description": "Evaluates whether EC2 instances are the t2.micro type.",
    "Scope": {
        "ComplianceResourceTypes": [
            "AWS::EC2::Instance"
        ]
    },
    "Source": {
        "Owner": "CUSTOM_LAMBDA",
        "SourceIdentifier": "arn:aws:lambda:us-
west-2:123456789012:function:InstanceTypeCheck",
        "SourceDetails": [
            {
                "EventSource": "aws.config",
                "MessageType": "ConfigurationItemChangeNotification"
            }
        ]
    },
    "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because this rule is a customer managed rule, the `Owner` attribute is set to `CUSTOM_LAMBDA`, and the `SourceIdentifier` attribute is set to the ARN of the AWS Lambda function. The `SourceDetails` object is required. The parameters that are specified for the `InputParameters` attribute are passed to the AWS Lambda function when AWS Config invokes it to evaluate resources against the rule.

This command produces no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

For more information, see AWS Config Custom Rules in the *AWS Config Developer Guide*.

- For API details, see PutConfigRule in *AWS CLI Command Reference*.

Python

### SDK for Python (Boto3)

> **Note**

# Updating AWS Config Rules

You can use the AWS Config console or the AWS SDKs to update your rules.

**Topics**

- Updating Rules (Console)
- Updating Rules (AWS SDKs)

## Updating Rules (Console)

The **Rules** page shows your rules and their current compliance results in a table. The result for each rule is **Evaluating...** until AWS Config finishes evaluating your resources against the rule. You can update the results with the refresh button. When AWS Config finishes evaluations, you can see the rules and resource types that are compliant or noncompliant. For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config.

**Updating rules**

**To update a rule**

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the left navigation, choose **Rules**.
4. Choose a rule and **Edit rule** for the rule that you want to update.
5. Modify the settings on the **Edit rule** page to change your rule as needed.
6. Choose **Save**.

# Updating Rules (AWS SDKs)

## Updating rules

If you are updating a rule that you added previously, you can specify the rule by `ConfigRuleName`, `ConfigRuleId`, or `ConfigRuleArn` in the `ConfigRule` data type that you use in this request. You use the same `PutConfigRule` command that you use when adding a rule.

The following code examples show how to use `PutConfigRule`.

CLI

### AWS CLI

#### Example 1: To add an AWS managed Config rule

The following `put-config-rule` example provides JSON code to add an AWS managed Config rule.

```
aws configservice put-config-rule \
    --config-rule file://RequiredTagsForEC2Instances.json
```

`RequiredTagsForEC2Instances.json` is a JSON file that contains the rule configuration.

Contents of `RequiredTagsForEC2Instances.json`:

```
{
    "ConfigRuleName": "RequiredTagsForEC2Instances",
    "Description": "Checks whether the CostCenter and Owner tags are applied to
 EC2 instances.",
    "Scope": {
        "ComplianceResourceTypes": [
            "AWS::EC2::Instance"
        ]
    },
    "Source": {
        "Owner": "AWS",
        "SourceIdentifier": "REQUIRED_TAGS"
    },
    "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because the rule is a managed rule, the `Owner` attribute is set to `AWS`, and the `SourceIdentifier` attribute is set to the rule identifier, `REQUIRED_TAGS`. For the `InputParameters` attribute, the tag keys that the rule requires, `CostCenter` and `Owner`, are specified.

This command produces no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

For more information, see AWS Config Managed Rules in the *AWS Config Developer Guide*.

**Example 2: To add a customer managed Config rule**

The following `put-config-rule` example provides JSON code to add a customer managed Config rule.

```
aws configservice put-config-rule \
    --config-rule file://InstanceTypesAreT2micro.json
```

`InstanceTypesAreT2micro.json` is a JSON file that contains the rule configuration.

Contents of `InstanceTypesAreT2micro.json`:

```
{
    "ConfigRuleName": "InstanceTypesAreT2micro",
    "Description": "Evaluates whether EC2 instances are the t2.micro type.",
    "Scope": {
        "ComplianceResourceTypes": [
            "AWS::EC2::Instance"
        ]
    },
    "Source": {
        "Owner": "CUSTOM_LAMBDA",
        "SourceIdentifier": "arn:aws:lambda:us-
west-2:123456789012:function:InstanceTypeCheck",
        "SourceDetails": [
            {
                "EventSource": "aws.config",
                "MessageType": "ConfigurationItemChangeNotification"
            }
```

```
        ]
    },
    "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

For the `ComplianceResourceTypes` attribute, this JSON code limits the scope to resources of the `AWS::EC2::Instance` type, so AWS Config will evaluate only EC2 instances against the rule. Because this rule is a customer managed rule, the `Owner` attribute is set to `CUSTOM_LAMBDA`, and the `SourceIdentifier` attribute is set to the ARN of the AWS Lambda function. The `SourceDetails` object is required. The parameters that are specified for the `InputParameters` attribute are passed to the AWS Lambda function when AWS Config invokes it to evaluate resources against the rule.

This command produces no output. To verify the rule configuration, run the describe-config-rules command, and specify the rule name.

For more information, see AWS Config Custom Rules in the *AWS Config Developer Guide*.

- For API details, see PutConfigRule in *AWS CLI Command Reference*.

Python

**SDK for Python (Boto3)**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class ConfigWrapper:
    """
    Encapsulates AWS Config functions.
    """

    def __init__(self, config_client):
        """
        :param config_client: A Boto3 AWS Config client.
        """
        self.config_client = config_client
```

```
    def put_config_rule(self, rule_name):
        """
        Sets a configuration rule that prohibits making Amazon S3 buckets
publicly
        readable.

        :param rule_name: The name to give the rule.
        """
        try:
            self.config_client.put_config_rule(
                ConfigRule={
                    "ConfigRuleName": rule_name,
                    "Description": "S3 Public Read Prohibited Bucket Rule",
                    "Scope": {
                        "ComplianceResourceTypes": [
                            "AWS::S3::Bucket",
                        ],
                    },
                    "Source": {
                        "Owner": "AWS",
                        "SourceIdentifier": "S3_BUCKET_PUBLIC_READ_PROHIBITED",
                    },
                    "InputParameters": "{}",
                    "ConfigRuleState": "ACTIVE",
                }
            )
            logger.info("Created configuration rule %s.", rule_name)
        except ClientError:
            logger.exception("Couldn't create configuration rule %s.", rule_name)
            raise
```

- For API details, see PutConfigRule in *AWS SDK for Python (Boto3) API Reference*.

SAP ABAP

**SDK for SAP ABAP**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    " Create a config rule for S3 bucket public read prohibition
    lo_cfs->putconfigrule(
      io_configrule = NEW /aws1/cl_cfsconfigrule(

        iv_description = |S3 Public Read Prohibited Bucket Rule|
        io_scope = NEW /aws1/cl_cfsscope(
          it_complianceresourcetypes = VALUE /aws1/
cl_cfscplncresrctypes_w=>tt_complianceresourcetypes(
            ( NEW /aws1/cl_cfscplncresrctypes_w( |AWS::S3::Bucket| ) )
          )
        )
        io_source = NEW /aws1/cl_cfssource(
          iv_owner = |AWS|
          iv_sourceidentifier = |S3_BUCKET_PUBLIC_READ_PROHIBITED|
        )
        iv_inputparameters = '{}'
        iv_configrulestate = |ACTIVE|
      )
    ).
    MESSAGE 'Created AWS Config rule.' TYPE 'I'.
```

- For API details, see PutConfigRule in *AWS SDK for SAP ABAP API reference*.

# Deleting AWS Config Rules

You can use the AWS Config console or the AWS SDKs to delete your rules.

**Topics**

- Considerations

- Deleting Rules (Console)
- Deleting Rules (AWS SDKs)

## Considerations

**Recommendation: Consider excluding the `AWS::Config::ResourceCompliance` resource type from recording before deleting rules**

Deleting rules creates configuration items (CIs) for `AWS::Config::ResourceCompliance` that can affect your costs for the configuration recorder. If you are deleting rules which evaluate a large number of resource types, this can lead to a spike in the number of CIs recorded.

To avoid the associated costs, you can opt to disable recording for the `AWS::Config::ResourceCompliance` resource type before deleting rules, and re-enable recording after the rules have been deleted.

However, since deleting rules is an asynchronous process, it might take an hour or more to complete. During the time when recording is disabled for `AWS::Config::ResourceCompliance`, rule evaluations will not be recorded in the associated resource's history.

## Deleting Rules (Console)

The **Rules** page shows your rules and their current compliance results in a table. The result for each rule is **Evaluating...** until AWS Config finishes evaluating your resources against the rule. You can update the results with the refresh button. When AWS Config finishes evaluations, you can see the rules and resource types that are compliant or noncompliant. For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config.

> **Note**
>
> AWS Config evaluates only the resource types that it is recording. For example, if you add the **cloudtrail-enabled** rule but don't record the CloudTrail trail resource type, AWS Config can't evaluate whether the trails in your account are compliant or noncompliant. For more information, see Recording AWS Resources with AWS Config.

### Deleting rules

#### To delete a rule

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the left navigation, choose **Rules**.
4. Choose a rule from the table that you want to delete.
5. From the **Actions** dropdown list, choose **Delete rule**.
6. When prompted, type "Delete" (case-sensitive) and then choose **Delete**.

## Deleting Rules (AWS SDKs)

### Deleting rules

The following code examples show how to use `DeleteConfigRule`.

CLI

**AWS CLI**

**To delete an AWS Config rule**

The following `delete-config-rule` example deletes an AWS Config rule named `MyConfigRule`.

```
aws configservice delete-config-rule \
    --config-rule-name MyConfigRule
```

This command produces no output.

For more information, see Deleting AWS Config Rules in the *AWS Config Developer Guide*.

- For API details, see DeleteConfigRule in *AWS CLI Command Reference*.

Python

### SDK for Python (Boto3)

> **Note**
>

# Viewing Details and Compliance Information for your AWS Config Rules

> **Important**
>
> For accurate reporting on the compliance status, you must record the `AWS::Config::ResourceCompliance` resource type. For more information, see Recording AWS Resources.

You can use the AWS Config console or the AWS SDKs to view your rules.

**Topics**

- Viewing Rules (Console)
- Viewing Rules (AWS SDKs)

## Viewing Rules (Console)

The **Rules** page shows your rules and their current compliance results in a table. The result for each rule is **Evaluating...** until AWS Config finishes evaluating your resources against the rule. You can

update the results with the refresh button. When AWS Config finishes evaluations, you can see the rules and resource types that are compliant or noncompliant. For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config.

> **Note**
>
> AWS Config evaluates only the resource types that it is recording. For example, if you add the **cloudtrail-enabled** rule but don't record the CloudTrail trail resource type, AWS Config can't evaluate whether the trails in your account are compliant or noncompliant. For more information, see Recording AWS Resources with AWS Config.

### Viewing rules

#### To view your rules

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the left navigation, choose **Rules**.
4. The **Rules** page shows all the rule that are currently in your AWS account. It lists the name, associated remediation action, and compliance status of each rule.
   - Choose **Add rule** to get started with creating a rule.
   - Choose a rule to see its settings, or choose a rule and **View details**.
   - See the compliance status of the rule when it evaluates your resources.
   - Choose a rule and **Edit rule** to change the configuration settings of the rule and set a remediation action for a noncompliant rule.

## Viewing Rules (AWS SDKs)

### Viewing details for your rules

The following code examples show how to use `DescribeConfigRules`.

CLI

## AWS CLI

### To get details for an AWS Config rule

The following `describe-config-rules` example returns details for an AWS Config rule named `InstanceTypesAreT2micro`.

```
aws configservice describe-config-rules \
    --config-rule-names InstanceTypesAreT2micro
```

Output:

```
{
    "ConfigRules": [
        {

PowerShell

**Tools for PowerShell V4**

**Example 1: This sample lists config rules for the account, with selected properties.**

```
Get-CFGConfigRule | Select-Object ConfigRuleName, ConfigRuleId, ConfigRuleArn,
 ConfigRuleState
```

**Output:**

```
ConfigRuleName                                     ConfigRuleId
 ConfigRuleArn
 ConfigRuleState
--------------                                     ------------
 -------------
 ---------------
ALB_REDIRECTION_CHECK                              config-rule-12iyn3
 arn:aws:config-service:eu-west-1:123456789012:config-rule/config-rule-12iyn3
 ACTIVE
access-keys-rotated                                config-rule-aospfr
 arn:aws:config-service:eu-west-1:123456789012:config-rule/config-rule-aospfr
 ACTIVE
autoscaling-group-elb-healthcheck-required         config-rule-cn1f2x
 arn:aws:config-service:eu-west-1:123456789012:config-rule/config-rule-cn1f2x
 ACTIVE
```

- For API details, see DescribeConfigRules in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

**Tools for PowerShell V5**

**Example 1: This sample lists config rules for the account, with selected properties.**

```
Get-CFGConfigRule | Select-Object ConfigRuleName, ConfigRuleId, ConfigRuleArn,
 ConfigRuleState
```

**Output:**

```
ConfigRuleName                                   ConfigRuleId
 ConfigRuleArn
 ConfigRuleState
--------------                                   ------------
 -------------
 ---------------
ALB_REDIRECTION_CHECK                            config-rule-12iyn3

## Python

### SDK for Python (Boto3)

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
class ConfigWrapper:
    """
    Encapsulates AWS Config functions.
    """

    def __init__(self, config_client):
```

```
        """
        :param config_client: A Boto3 AWS Config client.
        """
        self.config_client = config_client

    def describe_config_rule(self, rule_name):
        """
        Gets data for the specified rule.

        :param rule_name: The name of the rule to retrieve.
        :return: The rule data.
        """
        try:
            response = self.config_client.describe_config_rules(
                ConfigRuleNames=[rule_name]
            )
            rule = response["ConfigRules"]
            logger.info("Got data for rule %s.", rule_name)
        except ClientError:
            logger.exception("Couldn't get data for rule %s.", rule_name)
            raise
        else:
            return rule
```

- For API details, see DescribeConfigRules in *AWS SDK for Python (Boto3) API Reference*.

## SAP ABAP

### SDK for SAP ABAP

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
    DATA(lo_result) = lo_cfs->describeconfigrules(
      it_configrulenames = VALUE /aws1/
cl_cfsconfigrulenames_w=>tt_configrulenames(
```

```
        ( NEW /aws1/cl_cfsconfigrulenames_w( iv_rule_name ) )
      )
    ).
    ot_cfg_rules = lo_result->get_configrules( ).
    MESSAGE 'Retrieved AWS Config rule data.' TYPE 'I'.
```

- For API details, see DescribeConfigRules in *AWS SDK for SAP ABAP API reference*.

### Viewing compliance information for your rules

The following code examples show how to use `DescribeComplianceByConfigRule`.

CLI

#### AWS CLI

**To get compliance information for your AWS Config rules**

The following `describe-compliance-by-config-rule` example returns compliance information for each AWS Config rule that is violated by one or more AWS resources.

```
aws configservice describe-compliance-by-config-rule \
    --compliance-types NON_COMPLIANT
```

In the output, the value for each `CappedCount` attribute indicates how many resources do not comply with the related rule. For example, the following output indicates that 3 resources do not comply with the rule named `InstanceTypesAreT2micro`.

Output:

```
{
    "ComplianceByConfigRules": [
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 3,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "InstanceTypesAreT2micro"
```

```
        },
        {
            "Compliance": {
                "ComplianceContributorCount": {
                    "CappedCount": 10,
                    "CapExceeded": false
                },
                "ComplianceType": "NON_COMPLIANT"
            },
            "ConfigRuleName": "RequiredTagsForVolumes"
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see DescribeComplianceByConfigRule in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell V4**

**Example 1: This example retrieves compliances details for the rule ebs-optimized-instance, for which there is no current evaluation results for the rule, hence it returns INSUFFICIENT_DATA**

```
(Get-CFGComplianceByConfigRule -ConfigRuleName ebs-optimized-instance).Compliance
```

**Output:**

```
ComplianceContributorCount ComplianceType
------------------------- --------------
                           INSUFFICIENT_DATA
```

**Example 2: This example returns the number of non-compliant resources for the rule ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK.**

```
(Get-CFGComplianceByConfigRule -ConfigRuleName
 ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK -ComplianceType
 NON_COMPLIANT).Compliance.ComplianceContributorCount
```

**Output:**

```
CapExceeded CappedCount
----------- -----------
False       2
```

- For API details, see DescribeComplianceByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

**Tools for PowerShell V5**

**Example 1: This example retrieves compliances details for the rule ebs-optimized-instance, for which there is no current evaluation results for the rule, hence it returns INSUFFICIENT_DATA**

```
(Get-CFGComplianceByConfigRule -ConfigRuleName ebs-optimized-instance).Compliance
```

**Output:**

```
ComplianceContributorCount ComplianceType
-------------------------- --------------
                           INSUFFICIENT_DATA
```

**Example 2: This example returns the number of non-compliant resources for the rule ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK.**

```
(Get-CFGComplianceByConfigRule -ConfigRuleName
 ALB_HTTP_TO_HTTPS_REDIRECTION_CHECK -ComplianceType
 NON_COMPLIANT).Compliance.ComplianceContributorCount
```

**Output:**

```
CapExceeded CappedCount
----------- -----------
False       2
```

- For API details, see DescribeComplianceByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

### Viewing the compliance summary for your rules

The following code examples show how to use `GetComplianceSummaryByConfigRule`.

CLI

#### AWS CLI

**To get the compliance summary for your AWS Config rules**

The following `get-compliance-summary-by-config-rule` example returns the number of rules that are compliant and the number that are noncompliant.

```
aws configservice get-compliance-summary-by-config-rule
```

In the output, the value for each `CappedCount` attribute indicates how many rules are compliant or noncompliant.

Output:

```
{
    "ComplianceSummary": {
        "NonCompliantResourceCount": {
            "CappedCount": 3,
            "CapExceeded": false
        },
        "ComplianceSummaryTimestamp": 1452204131.493,
        "CompliantResourceCount": {
            "CappedCount": 2,
            "CapExceeded": false
        }
    }
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see GetComplianceSummaryByConfigRule in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell V4**

**Example 1: This sample returns the number of Config rules that are non-compliant.**

```
Get-CFGComplianceSummaryByConfigRule -Select
 ComplianceSummary.NonCompliantResourceCount
```

**Output:**

```
CapExceeded CappedCount
----------- -----------
False       9
```

- For API details, see GetComplianceSummaryByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

**Tools for PowerShell V5**

**Example 1: This sample returns the number of Config rules that are non-compliant.**

```
Get-CFGComplianceSummaryByConfigRule -Select
 ComplianceSummary.NonCompliantResourceCount
```

**Output:**

```
CapExceeded CappedCount
----------- -----------
False       9
```

- For API details, see GetComplianceSummaryByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

## Viewing the evaluation results for your rules

The following code examples show how to use `GetComplianceDetailsByConfigRule`.

CLI

## AWS CLI

### To get the evaluation results for an AWS Config rule

The following `get-compliance-details-by-config-rule` example returns the evaluation results for all of the resources that don't comply with an AWS Config rule named `InstanceTypesAreT2micro`.

```
aws configservice get-compliance-details-by-config-rule \
    --config-rule-name InstanceTypesAreT2micro \
    --compliance-types NON_COMPLIANT
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-1a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.261,
            "ConfigRuleInvokedTime": 1450314642.948,
            "ComplianceType": "NON_COMPLIANT"
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-2a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314645.18,
            "ConfigRuleInvokedTime": 1450314642.902,
            "ComplianceType": "NON_COMPLIANT"
```

```
        },
        {
            "EvaluationResultIdentifier": {
                "OrderingTimestamp": 1450314635.065,
                "EvaluationResultQualifier": {
                    "ResourceType": "AWS::EC2::Instance",
                    "ResourceId": "i-3a2b3c4d",
                    "ConfigRuleName": "InstanceTypesAreT2micro"
                }
            },
            "ResultRecordedTime": 1450314643.346,
            "ConfigRuleInvokedTime": 1450314643.124,
            "ComplianceType": "NON_COMPLIANT"
        }
    ]
}
```

For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config in the *AWS Config Developer Guide*.

- For API details, see GetComplianceDetailsByConfigRule in *AWS CLI Command Reference*.

PowerShell

**Tools for PowerShell V4**

**Example 1: This example obtains the evaluation results for the rule access-keys-rotated and returns the output grouped by compliance-type**

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-keys-rotated | Group-
Object ComplianceType
```

**Output:**

```
Count Name                      Group
----- ----                      -----
    2 COMPLIANT                 {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult}
    5 NON_COMPLIANT             {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationRes...
```

**Example 2: This example queries compliance details for the rule access-keys-rotated for COMPLIANT resources.**

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-
keys-rotated -ComplianceType COMPLIANT | ForEach-Object
 {$_.EvaluationResultIdentifier.EvaluationResultQualifier}
```

**Output:**

```
ConfigRuleName      ResourceId            ResourceType
--------------      ----------            ------------
access-keys-rotated BCAB1CDJ2LITAPVEW3JAH AWS::IAM::User
access-keys-rotated BCAB1CDJ2LITL3EHREM4Q AWS::IAM::User
```

- For API details, see GetComplianceDetailsByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V4)*.

**Tools for PowerShell V5**

**Example 1: This example obtains the evaluation results for the rule access-keys-rotated and returns the output grouped by compliance-type**

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-keys-rotated | Group-
Object ComplianceType
```

**Output:**

```
Count Name                      Group
----- ----                      -----
    2 COMPLIANT                 {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult}
    5 NON_COMPLIANT             {Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationResult,
 Amazon.ConfigService.Model.EvaluationRes...
```

**Example 2: This example queries compliance details for the rule access-keys-rotated for COMPLIANT resources.**

```
Get-CFGComplianceDetailsByConfigRule -ConfigRuleName access-
keys-rotated -ComplianceType COMPLIANT | ForEach-Object
 {$_.EvaluationResultIdentifier.EvaluationResultQualifier}
```

**Output:**

```
ConfigRuleName      ResourceId            ResourceType
--------------      ----------            ------------
access-keys-rotated BCAB1CDJ2LITAPVEW3JAH AWS::IAM::User
access-keys-rotated BCAB1CDJ2LITL3EHREM4Q AWS::IAM::User
```

- For API details, see GetComplianceDetailsByConfigRule in *AWS Tools for PowerShell Cmdlet Reference (V5)*.

# Turning on Proactive Evaluation for AWS Config Rules

You can use the AWS Config console or the AWS SDKs to turn on proactive evaluation rules. For a list of resource types and managed rules that support proactive evaluation, see Components of a Rule | Evaluation Modes.

**Topics**

- Turning on Proactive Evaluation (Console)
- Turning on Proactive Evaluation (AWS SDKs)

## Turning on Proactive Evaluation (Console)

The **Rules** page shows your rules and their current compliance results in a table. The result for each rule is **Evaluating...** until AWS Config finishes evaluating your resources against the rule. You can update the results with the refresh button.

When AWS Config finishes evaluations, you can see the rules and resource types that are compliant or noncompliant. For more information, see Viewing Compliance Information and Evaluation Results for your AWS Resources with AWS Config.

> **Note**
>
> AWS Config evaluates only the resource types that it is recording. For example, if you add the **cloudtrail-enabled** rule but don't record the CloudTrail trail resource type, AWS Config can't evaluate whether the trails in your account are compliant or noncompliant. For more information, see Recording AWS Resources with AWS Config.

### Turning on proactive evaluation

You can use *proactive evaluation* to evaluate resources before they have been deployed. This allows you to evaluate whether a set of resource properties, if used to define an AWS resource, would be COMPLIANT or NON_COMPLIANT given the set of proactive rules that you have in your account in your Region.

The Resource type schema states the properties of a resource. You can find the resource type schema in "*AWS public extensions*" within the AWS CloudFormation registry or with the following CLI commmand:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

For more information, see Managing extensions through the CloudFormation registry and AWS resource and property types reference in the AWS CloudFormation User Guide.

> **Note**
>
> Proactive rules do not remediate resources that are flagged as NON_COMPLIANT or prevent them from being deployed.

#### To turn on proactive evalution

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the Region selector is set to a Region that supports AWS Config rules. For the list of supported AWS Regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the left navigation, choose **Rules**. For a list of managed rules that support proactive evaluation, see List of AWS Config Managed Rules by Evaluation Mode.
4. Choose a rule, and then choose **Edit rule** for the rule that you want to update.
5. For **Evaluation mode**, choose **Turn on proactive evaluation** to allow you to run evaluations on the configuration settings of your resources before they are deployed.
6. Choose **Save**.

After you have turned on proactive evaluation, you can use the StartResourceEvaluation API and GetResourceEvaluationSummary API to check if the resources you specify in these commands would be flagged as NON_COMPLIANT by the proactive rules in your account in your Region.

For example, start with the StartResourceEvaluation API:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

You should receive the `ResourceEvaluationId` in the output:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

Then, use the `ResourceEvaluationId` with the GetResourceEvaluationSummary API to check the evaluation result:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

You should receive output similiar to the following:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
```

```
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

To see additional information about the evaluation result, such as which rule flagged a resource as NON_COMPLIANT, use the GetComplianceDetailsByResource API.

## Turning on Proactive Evaluation (AWS SDKs)

### Turning on proactive evaluation (AWS CLI)

You can use *proactive evaluation* to evaluate resources before they have been deployed. This allows you to evaluate whether a set of resource properties, if used to define an AWS resource, would be COMPLIANT or NON_COMPLIANT given the set of proactive rules that you have in your account in your Region.

The Resource type schema states the properties of a resource. You can find the resource type schema in "*AWS public extensions*" within the AWS CloudFormation registry or with the following CLI commmand:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

For more information, see Managing extensions through the CloudFormation registry and AWS resource and property types reference in the AWS CloudFormation User Guide.

> **Note**
>
> Proactive rules do not remediate resources that are flagged as NON_COMPLIANT or prevent them from being deployed.

#### To turn on proactive evaluation

Use the `put-config-rule` command and enable `PROACTIVE` for `EvaluationModes`.

After you have turned on proactive evaluation, you can use the start-resource-evaluation CLI command and get-resource-evaluation-summary CLI command to check if the resources you specify in these commands would be flagged as NON_COMPLIANT by the proactive rules in your account in your Region.

For example, start with the **start-resource-evaluation** command:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

You should receive the `ResourceEvaluationId` in the output:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

Then, use the `ResourceEvaluationId` with the **get-resource-evaluation-summary** to check the evaluation result:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

You should receive output similiar to the following:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

To see additional information about the evaluation result, such as which rule flagged a resource as NON_COMPLIANT, use the get-compliance-details-by-resource CLI command.

> **Note**
>
> For a list of managed rules that support proactive evaluation, see List of AWS Config Managed Rules by Evaluation Mode.

### Turning on proactive evaluation (API)

You can use *proactive evaluation* to evaluate resources before they have been deployed. This allows you to evaluate whether a set of resource properties, if used to define an AWS resource, would be COMPLIANT or NON_COMPLIANT given the set of proactive rules that you have in your account in your Region.

The Resource type schema states the properties of a resource. You can find the resource type schema in "*AWS public extensions*" within the AWS CloudFormation registry or with the following CLI commmand:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

For more information, see Managing extensions through the CloudFormation registry and AWS resource and property types reference in the AWS CloudFormation User Guide.

> **Note**
>
> Proactive rules do not remediate resources that are flagged as NON_COMPLIANT or prevent them from being deployed.

#### To turn on proactive evaluation for a rule

Use the PutConfigRule action and enable `PROACTIVE` for `EvaluationModes`.

After you have turned on proactive evaluation, you can use the StartResourceEvaluation API and GetResourceEvaluationSummary API to check if the resources you specify in these commands would be flagged as NON_COMPLIANT by the proactive rules in your account in your Region. For example, start with the StartResourceEvaluation API:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

You should receive the `ResourceEvaluationId` in the output:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

Then, use the `ResourceEvaluationId` with the GetResourceEvaluationSummary API to check the evaluation result:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

You should receive output similiar to the following:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

To see additional information about the evaluation result, such as which rule flagged a resource as NON_COMPLIANT, use the GetComplianceDetailsByResource API.

> **Note**
>
> For a list of managed rules that support proactive evaluation, see List of AWS Config Managed Rules by Evaluation Mode.

# Sending Rule Evaluations to Security Hub CSPM

After adding an AWS Config rule, you can also send rule evaluations to AWS Security Hub CSPM. The integration between AWS Config and Security Hub CSPM allows you to triage and remediate rule evaluations alongside other misconfigurations and security issues.

## Send Rule Evaluations to Security Hub CSPM

To send rule evaluations to Security Hub CSPM, you must first set up AWS Security Hub CSPM and AWS Config, and then add at least one AWS Config managed or custom rule. After this, AWS Config immediately starts sending rule evaluations to Security Hub CSPM. Security Hub CSPM enriches the rule evaluations and transforms them into Security Hub CSPM findings.

For more information about this integration, see Available AWS Service Integrations in the AWS Security Hub CSPM User Guide.

# Evaluating Your Resources with AWS Config Rules

When you create custom rules or use managed rules, AWS Config evaluates your resources against those rules. You can run on-demand evaluations for resources against your rules. For example, this is helpful when you create a custom rule and want to check that AWS Config is correctly evaluating your resources or to identify if there is an issue with the evaluation logic of your AWS Lambda function.

**Example**

1. You create a custom rule that evaluates whether your IAM users have active access keys.
2. AWS Config evaluates your resources against your custom rule.
3. An IAM user who doesn't have an active access key exists in your account. Your rule doesn't correctly flag this resource as NON_COMPLIANT.
4. You fix the rule and start the evaluation again.

5. Because you fixed your rule, the rule correctly evaluates your resources, and flags the IAM user resource as NON_COMPLIANT.

When you add a rule to your account, you can specify when in the resource creation and management process that you want AWS Config to evaluate your resources. The resource creation and management process is known as resource provisioning. You choose the *evaluation mode* to specify when in this process you want AWS Config to evaluate your resources.

Depending on the rule, AWS Config can evaluate your resource configurations before a resource has been deployed, after a resource has been deployed, or both. Evaluating a resource before it has been deployed is **proactive evaluation**. Evaluating a resource after it has been deployed is **detective evaluation**.

## Proactive mode

Use proactive evaluation to evaluate resources before they have been deployed. This allows you to evaluate whether a set of resource properties, if used to define an AWS resource, would be COMPLIANT or NON_COMPLIANT given the set of proactive rules that you have in your account in your Region.

The Resource type schema states the properties of a resource. You can find the resource type schema in "*AWS public extensions*" within the AWS CloudFormation registry or with the following CLI commmand:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

For more information, see Managing extensions through the CloudFormation registry and AWS resource and property types reference in the AWS CloudFormation User Guide.

> **Note**
>
> Proactive rules do not remediate resources that are flagged as NON_COMPLIANT or prevent them from being deployed.

### Evaluating your Resources

#### To turn on proactive evalution

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the Region selector is set to a Region that supports AWS Config rules. For the list of supported AWS Regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the left navigation, choose **Rules**. For a list of managed rules that support proactive evaluation, see List of AWS Config Managed Rules by Evaluation Mode.
4. Choose a rule, and then choose **Edit rule** for the rule that you want to update.
5. For **Evaluation mode**, choose **Turn on proactive evaluation** to allow you to run evaluations on the configuration settings of your resources before they are deployed.
6. Choose **Save**.

> **Note**
>
> You can also turn on proactive evaluation using the `put-config-rule` command and enabling `PROACTIVE` for `EvaluationModes` or using the PutConfigRule action and enabling `PROACTIVE` for `EvaluationModes`.

After you have turned on proactive evaluation, you can use the StartResourceEvaluation API and GetResourceEvaluationSummary API to check if the resources you specify in these commands would be flagged as NON_COMPLIANT by the proactive rules in your account in your Region.

For example, start with the StartResourceEvaluation API:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

You should receive the `ResourceEvaluationId` in the output:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

Then, use the `ResourceEvaluationId` with the GetResourceEvaluationSummary API to check the evaluation result:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

You should receive output similiar to the following:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

To see additional information about the evaluation result, such as which rule flagged a resource as NON_COMPLIANT, use the GetComplianceDetailsByResource API.

## Detective mode

Use detective evaluation to evaluate resources that have already been deployed. This allows you to evaluate the configuration settings of your existing resources.

### Evaluating your Resources (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.

2. In the AWS Management Console menu, check that the region selector is set to a Region that supports AWS Config rules. For the list of supported regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the navigation pane, choose **Rules**. The **Rules** page shows the name, associated remediation action, and compliance status of each rule.
4. Choose a rule from the table.
5. From the **Actions** dropdown list, choose **Re-evaluate**.
6. AWS Config starts evaluating the resources against your rule.

> **Note**
>
> You can re-evaluate a rule one time each minute. You must wait for AWS Config to complete the evaluation for your rule before you start another evaluation. You can't run an evaluation if at the same time the rule is being updated or if the rule is being deleted.

### Evaluating your Resources (CLI)

- Use the **start-config-rules-evaluation** command:

```
$ aws configservice start-config-rules-evaluation --config-rule-
names ConfigRuleName
```

AWS Config starts evaluating the recorded resource configurations against your rule. You can also specify multiple rules in your request:

```
$ aws configservice start-config-rules-evaluation --config-rule-
names ConfigRuleName1 ConfigRuleName2 ConfigRuleName3
```

### Evaluating your Resources (API)

Use the StartConfigRulesEvaluation action.

# Deleting Evaluation Results from AWS Config Rules

After AWS Config evaluates your rule, you can see the evaluation results on the **Rules** page or the **Rules details** page for the rule. If the evaluation results are incorrect or if you want to evaluate again, you can delete the current evaluation results for the rule. For example, if your rule was incorrectly evaluating your resources or you recently deleted resources from your account, you can delete the evaluation results and then run a new evaluation.

Deleting Evaluation Results (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. In the AWS Management Console menu, verify that the Region selector is set to an AWS Region that supports AWS Config rules. For the list of supported Regions, see AWS Config Regions and Endpoints in the *Amazon Web Services General Reference*.
3. In the navigation pane, choose **Rules**. The **Rules** page shows the name, associated remediation action, and compliance status of each rule.
4. Choose a rule from the table.
5. From the **Actions** dropdown list, choose **Delete results**.
6. When prompted, type **Delete** (this entry is case sensitive), and then choose **Delete**. After you delete an evaluation, you cannot retrieve it.
7. After the evaluation results are deleted, you can manually start a new evaluation.

Deleting Evaluation Results (CLI)

- Use the **delete-evaluation-results** command.

```
$ aws configservice delete-evaluation-results --config-rule-name ConfigRuleName
```

  AWS Config deletes the evaluation results for the rule.

Deleting Evaluation Results (API)

Use the DeleteEvaluationResults action.

# Troubleshooting for AWS Config rules

Check the following issues to troubleshoot if you cannot delete an AWS Config rule or receive an error similair to the following: "An error has occurred with AWS Config."

### The AWS Identity and Access Management (IAM) entity has permissions for the DeleteConfigRule API

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane choose **Users** or **Roles**.
3. Choose the user or role that you used to delete the AWS Config rule, and expand **Permissions policies**.
4. In the **Permissions** tab, choose **JSON**.
5. In the JSON preview pane, confirm that the IAM policy allows permissions for the DeleteConfigRule API.

### The IAM entity permission boundary allows the DeleteConfigRule API

If the IAM entity has a permissions boundary, be sure that it allows permissions for the the DeleteConfigRule API.

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane choose **Users** or **Roles**.
3. Choose the user or role that you used to delete the AWS Config rule, expand **Permissions boundary**, and then choose **JSON**.
4. In the JSON preview pane, confirm that the IAM policy allows permissions for the DeleteConfigRule API.

> **Warning**
>
> IAM users have long-term credentials, which presents a security risk. To help mitigate this risk, we recommend that you provide these users with only the permissions they require to perform the task and that you remove these users when they are no longer needed.

### The service control policy (SCP) allows the DeleteConfigRule API

1. Open the AWS Organizations console at https://console.aws.amazon.com/organizations/ using the management account for the organization.
2. In Account name, choose the AWS account.
3. In **Policies**, expand **Service control policies** and note the SCP policies that are attached.
4. At the top of the page, choose **Policies**.
5. Select the policy, and then choose **View details**.
6. In the JSON preview pane, confirm that the policy allows the DeleteConfigRule API.

### The rule is not a service-linked rule

When you enable a security standard, AWS Security Hub CSPM creates service-linked rules for you. You can't delete these service-linked rules using AWS Config, and the delete button is grayed out. To remove a service-linked rule, see Disabling a security standard in the *Security Hub CSPM User Guide*.

### No remediation actions are in progress

You cannot delete AWS Config rules that have remediation actions in progress. Follow the steps to delete the remediation action that is associated with that rule. Then, try deleting the rule again.

> **Important**
>
> Only delete remediation actions that are in **failed** or **successful** states.

# Conformance Packs for AWS Config

A conformance pack is a collection of AWS Config rules and remediation actions that can be deployed as a single entity. AWS Config supports managed conformance packs and custom conformance packs.

- AWS managed conformance packs are predefined and maintained by AWS. You can deploy an AWS managed conformance pack to an account and an AWS Region without creating or maintaining a conformance pack template.
- Custom conformance packs are created by authoring a YAML template that contains a list of AWS Config managed or custom rules and remediation actions. Custom conformance packs can be deployed to an account and an AWS Region or across an organization in AWS Organizations. You can also use AWS Systems Manager documents (SSM documents) to store your custom conformance pack templates on AWS and directly deploy conformance packs using SSM document names. You can deploy the template by using the AWS Config console or the AWS CLI.

To get started, you can deploy a managed conformance pack or create your own custom conformance pack. AWS Config also provides sample conformance pack templates that you can use as a starting point for creating your own conformance packs.

**Topics**

- Prerequisites for Conformance Packs for AWS Config
- Viewing Compliance Data in the Conformance Packs Dashboard for AWS Config
- Region Support

- Deploying Conformance Packs for AWS Config
- Editing Conformance Packs for AWS Config
- Deleting Conformance Packs for AWS Config
- Viewing Details and Compliance Information for your Conformance Packs for AWS Config
- Viewing the Compliance History Timeline for Conformance Packs for AWS Config
- Querying Compliance History for Conformance Packs for AWS Config

- Managing Conformance Packs for AWS Config Across all Accounts in Your Organization
- Troubleshooting for Conformance Packs for AWS Config

# Prerequisites for Conformance Packs for AWS Config

Before you deploy your conformance pack, turn on AWS Config recording.

**Topics**

- Step 1: Start AWS Config Recording (Required for all conformance packs)
- Step 2: Additional prerequisites for custom conformance packs

## Step 1: Start AWS Config Recording (Required for all conformance packs)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Choose **Settings** in the navigation pane.
3. To start recording, under **Recording is off**, choose **Turn on**. When prompted, choose **Continue**.

For managed conformance packs, we recommend recording all supported resource types so that every rule in the pack can evaluate your resources.

## Step 2: Additional prerequisites for custom conformance packs

### Prerequisites for Using a Conformance Pack With Remediation

Before deploying conformance packs using sample templates with remediation, you must create appropriate resources such as automation assume role and other AWS resources based on your remediation target.

If you have an existing automation role that you are using for remediation using SSM documents, you can directly provide the ARN of that role. If you have any resources you can provide those in the template.

> **Note**
>
> When deploying a conformance pack with remediation to an organization, the management account ID of the organization needs to be specified. Otherwise, during deployment of the organizational conformance pack AWS Config replaces the management account ID with the member account ID automatically.

AWS Config does not support CloudFormation intrinsic functions for the automation execution role or the `ConfigRuleName`. You must provide the exact ARN of the role as a string, and you must use the complete rule name without intrinsic functions.

For more information about how to pass the exact ARN, see Conformance Pack Sample Templates for AWS Config. While using example templates, update your Account ID and management account ID for organization.

## Prerequisites for Using a Conformance Pack With One or More Custom AWS Config Rules

Before deploying a conformance pack with one or more custom AWS Config rules, create appropriate resources such as AWS Lambda function and the corresponding execution role.

If you have an existing custom AWS Config rule, you can directly provide the `ARN` of AWS Lambda function to create another instance of that custom rule as part of the pack.

If you do not have an existing custom AWS Config rule, you can create a AWS Lambda function and use the ARN of the Lambda function. For more information, see AWS Config Custom Rules.

If your AWS Lambda function is present in a different AWS account, you can create AWS Config rules with appropriate cross-account AWS Lambda function authorization. For more information, see How to Centrally Manage AWS Config Rules across Multiple AWS accounts blog post.

Same account bucket policy

For AWS Config to be able to store conformance pack artifacts, you will need to provide an Amazon S3 bucket and add the following permissions. For more information on naming your bucket, see Bucket naming rules.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AWSConfigConformsBucketPermissionsCheck",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::111122223333:role/aws-service-role/config-
conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                ]
            },
            "Action": "s3:GetBucketAcl",
            "Resource": "arn:aws:s3:::delivery-bucket-name"
        },
        {
            "Sid": "AWSConfigConformsBucketDelivery",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::111122223333:role/aws-service-role/config-
conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                ]
            },
            "Action": "s3:PutObject",
            "Resource": "arn:aws:s3:::delivery-bucket-name/[optional] prefix/
AWSLogs/AccountId/Config/*",
            "Condition": {
                "StringEquals": {
                    "s3:x-amz-acl": "bucket-owner-full-control"
                }
            }
        }
    ]
}
```

Cross-account bucket policy

For AWS Config to be able to store conformance pack artifacts, you will need to provide an Amazon S3 bucket and add the following permissions. For more information on naming your bucket, see Bucket naming rules.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AWSConfigConformsBucketPermissionsCheck",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::111122223333:role/aws-service-role/config-
conforms.amazonaws.com/AWSServiceRoleForConfigConforms",
                    "PutConformancePack API caller user principal like
 arn:aws:iam::SourceAccountId:user/userName "
                ]
            },
            "Action": "s3:GetBucketAcl",
            "Resource": "arn:aws:s3:::awsconfigconforms-suffix in bucket name"
        },
        {
            "Sid": "AWSConfigConformsBucketDelivery",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::111122223333:role/aws-service-role/config-
conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                ]
            },
            "Action": "s3:PutObject",
            "Resource": "arn:aws:s3:::awsconfigconforms-suffix in bucket name/
[optional] prefix/AWSLogs/AccountID/Config/*",
            "Condition": {
                "StringEquals": {
                    "s3:x-amz-acl": "bucket-owner-full-control"
                }
            }
        },
```

```
        {
            "Sid": " AWSConfigConformsBucketReadAccess",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::111122223333:role/aws-service-role/config-
conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                ]
            },
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::awsconfigconforms-suffix in bucket name/
[optional] prefix/AWSLogs/AccountID/Config/*"
        }
    ]
}
```

> **Note**
>
> When deploying cross-account conformance packs, the name of the delivery Amazon S3 bucket should start with `awsconfigconforms`.

## Prerequisites for Organization Conformance Packs

Specify an automation execution role ARN for that remediation in the template if the input template has an autoremediation configuration. Ensure a role with the specified name exists in all the accounts (management and member) of an organization. You must create this role in all accounts before calling `PutOrganizationConformancePack`. You can create this role manually or using the AWS CloudFormation stack-sets to create this role in every account.

If your template uses AWS CloudFormation intrinsic function `Fn::ImportValue` to import a particular variable, then that variable must be defined as an `Export Value` in all the member accounts of that organization.

For custom AWS Config rule, see How to Centrally Manage AWS Config Rules across Multiple AWS accounts blog to setup proper permissions.

**Organization bucket policy:**

For AWS Config to be able to store conformance pack artifacts, you will need to provide an Amazon S3 bucket and add the following permissions. For more information on naming your bucket, see Bucket naming rules.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Sid": "AllowGetObject",
            "Effect": "Allow",
            "Principal": "*",
            "Action": [
                 "s3:GetObject",
                 "s3:PutObject"
            ],
            "Resource": "arn:aws:s3:::awsconfigconforms-suffix in bucket name/*",
            "Condition": {
                "StringEquals": {
                    "aws:PrincipalOrgID": "customer_org_id"
                },
                "ArnLike": {
                    "aws:PrincipalArn": "arn:aws:iam::*:role/aws-service-role/
config-conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                }
            }
        },
        {
            "Sid": "AllowGetBucketAcl",
            "Effect": "Allow",
            "Principal": "*",
            "Action": "s3:GetBucketAcl",
            "Resource": "arn:aws:s3:::awsconfigconforms-suffix in bucket name",
            "Condition": {
                "StringEquals": {
                    "aws:PrincipalOrgID": "customer_org_id"
                },
                "ArnLike": {
                    "aws:PrincipalArn": "arn:aws:iam::*:role/aws-service-role/
config-conforms.amazonaws.com/AWSServiceRoleForConfigConforms"
                }
```

```
            }
        }
    ]
}
```

> **Note**
>
> When deploying conformance packs to an organization, the name of the delivery Amazon S3 bucket should start with `awsconfigconforms`.

# Viewing Compliance Data in the Conformance Packs Dashboard for AWS Config

The main page for **Conformance Packs** displays all of the conformance packs that you currently have in your AWS account. The page also contains the name, deployment status, and compliance score of each conformance pack. A compliance score is the percentage of the number of compliant rule-resource combinations in a conformance pack compared to the number of total possible rule-resource combinations in the conformance pack.

You can use this dashboard to understand the level of compliance of your conformance packs and use the compliance score to track remediation progress, perform comparisons across different sets of requirements, and see the impact a specific change or deployment has on a conformance pack. While a conformance pack is deploying, its compliance and compliance score can be incomplete. To learn how to check the deployment status of a conformance pack, see Viewing Conformance Packs.

## Navigating the Conformance Packs Main Page

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Navigate to the **Conformance packs** page. Review your conformance packs and their compliance score. You can also do the following:
   - To add and configure a new conformance pack, choose **Deploy conformance pack**.
   - To delete a conformance pack and its data, change the configuration settings, or view additional details, such as the delivery location or parameters, choose a conformance pack and choose **Actions**.

> **Note**
>
> You cannot edit a deployed conformance pack. You can modify the other selections at any time by choosing the name of the conformance pack and **Edit** in the **Actions** dropdown.

- To view the history of compliance state changes, choose a conformance pack and choose **Conformance pack timeline**. For more information, see Viewing the Compliance History Timeline for Conformance Packs.
- To view the deployment status, compliance score, compliance score timeline, and rules for a conformance pack in a detailed view, choose a conformance pack and choose **View**.

## Region Support

Conformance packs are supported in the following Regions.

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| US East (Ohio) | us-east-2 | config.us-east-2.amazonaws.com | HTTPS |
| US East (N. Virginia) | us-east-1 | config.us-east-1.amazonaws.com | HTTPS |
| US West (N. California) | us-west-1 | config.us-west-1.amazonaws.com | HTTPS |
| US West (Oregon) | us-west-2 | config.us-west-2.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol | |
|---|---|---|---|---|
| Africa (Cape Town) | af-south-1 | config.af-south-1.amazonaws.com | HTTPS | |
| Asia Pacific (Hong Kong) | ap-east-1 | config.ap-east-1.amazonaws.com | HTTPS | |
| Asia Pacific (Hyderabad) | ap-south-2 | config.ap-south-2.amazonaws.com | HTTPS | |
| Asia Pacific (Jakarta) | ap-southeast-3 | config.ap-southeast-3.amazonaws.com | HTTPS | |
| Asia Pacific (Malaysia) | ap-southeast-5 | config.ap-southeast-5.amazonaws.com | HTTPS | |
| Asia Pacific (Melbourne) | ap-southeast-4 | config.ap-southeast-4.amazonaws.com | HTTPS | |
| Asia Pacific (Mumbai) | ap-south-1 | config.ap-south-1.amazonaws.com | HTTPS | |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| Asia Pacific (New Zealand) | ap-southeast-6 | config.ap-southeast-6.amazonaws.com | HTTPS |
| Asia Pacific (Osaka) | ap-northeast-3 | config.ap-northeast-3.amazonaws.com | HTTPS |
| Asia Pacific (Seoul) | ap-northeast-2 | config.ap-northeast-2.amazonaws.com | HTTPS |
| Asia Pacific (Singapore) | ap-southeast-1 | config.ap-southeast-1.amazonaws.com | HTTPS |
| Asia Pacific (Sydney) | ap-southeast-2 | config.ap-southeast-2.amazonaws.com | HTTPS |
| Asia Pacific (Taipei) | ap-east-2 | config.ap-east-2.amazonaws.com | HTTPS |
| Asia Pacific (Thailand) | ap-southeast-7 | config.ap-southeast-7.amazonaws.com | HTTPS |
| Asia Pacific (Tokyo) | ap-northeast-1 | config.ap-northeast-1.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| Canada (Central) | ca-central-1 | config.ca-central-1.amazonaws.com | HTTPS |
| Canada West (Calgary) | ca-west-1 | config.ca-west-1.amazonaws.com | HTTPS |
| Europe (Frankfurt) | eu-central-1 | config.eu-central-1.amazonaws.com | HTTPS |
| Europe (Ireland) | eu-west-1 | config.eu-west-1.amazonaws.com | HTTPS |
| Europe (London) | eu-west-2 | config.eu-west-2.amazonaws.com | HTTPS |
| Europe (Milan) | eu-south-1 | config.eu-south-1.amazonaws.com | HTTPS |
| Europe (Paris) | eu-west-3 | config.eu-west-3.amazonaws.com | HTTPS |
| Europe (Spain) | eu-south-2 | config.eu-south-2.amazonaws.com | HTTPS |
| Europe (Stockholm) | eu-north-1 | config.eu-north-1.amazonaws.com | HTTPS |
| Europe (Zurich) | eu-central-2 | config.eu-central-2.amazonaws.com | HTTPS |
| Israel (Tel Aviv) | il-central-1 | config.il-central-1.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| Mexico (Central) | mx-central-1 | config.mx-central-1.amazonaws.com | HTTPS |
| Middle East (Bahrain) | me-south-1 | config.me-south-1.amazonaws.com | HTTPS |
| Middle East (UAE) | me-central-1 | config.me-central-1.amazonaws.com | HTTPS |
| South America (São Paulo) | sa-east-1 | config.sa-east-1.amazonaws.com | HTTPS |
| AWS GovCloud (US-East) | us-gov-east-1 | config.us-gov-east-1.amazonaws.com | HTTPS |
| AWS GovCloud (US-West) | us-gov-west-1 | config.us-gov-west-1.amazonaws.com | HTTPS |

Deploying conformance packs across member accounts in an AWS Organization is supported in the following Regions.

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| US East (Ohio) | us-east-2 | config.us-east-2.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| US East (N. Virginia) | us-east-1 | config.us-east-1.amazonaws.com | HTTPS |
| US West (N. California) | us-west-1 | config.us-west-1.amazonaws.com | HTTPS |
| US West (Oregon) | us-west-2 | config.us-west-2.amazonaws.com | HTTPS |
| Africa (Cape Town) | af-south-1 | config.af-south-1.amazonaws.com | HTTPS |
| Asia Pacific (Hong Kong) | ap-east-1 | config.ap-east-1.amazonaws.com | HTTPS |
| Asia Pacific (Hyderabad) | ap-south-2 | config.ap-south-2.amazonaws.com | HTTPS |
| Asia Pacific (Jakarta) | ap-southeast-3 | config.ap-southeast-3.amazonaws.com | HTTPS |
| Asia Pacific (Malaysia) | ap-southeast-5 | config.ap-southeast-5.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| Asia Pacific (Melbourne) | ap-southeast-4 | config.ap-southeast-4.amazonaws.com | HTTPS |
| Asia Pacific (Mumbai) | ap-south-1 | config.ap-south-1.amazonaws.com | HTTPS |
| Asia Pacific (New Zealand) | ap-southeast-6 | config.ap-southeast-6.amazonaws.com | HTTPS |
| Asia Pacific (Osaka) | ap-northeast-3 | config.ap-northeast-3.amazonaws.com | HTTPS |
| Asia Pacific (Seoul) | ap-northeast-2 | config.ap-northeast-2.amazonaws.com | HTTPS |
| Asia Pacific (Singapore) | ap-southeast-1 | config.ap-southeast-1.amazonaws.com | HTTPS |
| Asia Pacific (Sydney) | ap-southeast-2 | config.ap-southeast-2.amazonaws.com | HTTPS |
| Asia Pacific (Taipei) | ap-east-2 | config.ap-east-2.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| Asia Pacific (Thailand) | ap-southeast-7 | config.ap-southeast-7.amazonaws.com | HTTPS |
| Asia Pacific (Tokyo) | ap-northeast-1 | config.ap-northeast-1.amazonaws.com | HTTPS |
| Canada (Central) | ca-central-1 | config.ca-central-1.amazonaws.com | HTTPS |
| Canada West (Calgary) | ca-west-1 | config.ca-west-1.amazonaws.com | HTTPS |
| Europe (Frankfurt) | eu-central-1 | config.eu-central-1.amazonaws.com | HTTPS |
| Europe (Ireland) | eu-west-1 | config.eu-west-1.amazonaws.com | HTTPS |
| Europe (London) | eu-west-2 | config.eu-west-2.amazonaws.com | HTTPS |
| Europe (Milan) | eu-south-1 | config.eu-south-1.amazonaws.com | HTTPS |
| Europe (Paris) | eu-west-3 | config.eu-west-3.amazonaws.com | HTTPS |
| Europe (Spain) | eu-south-2 | config.eu-south-2.amazonaws.com | HTTPS |

| Region Name | Region | Endpoint | Protocol |
|---|---|---|---|
| Europe (Stockholm) | eu-north-1 | config.eu-north-1.amazonaws.com | HTTPS |
| Europe (Zurich) | eu-central-2 | config.eu-central-2.amazonaws.com | HTTPS |
| Israel (Tel Aviv) | il-central-1 | config.il-central-1.amazonaws.com | HTTPS |
| Mexico (Central) | mx-central-1 | config.mx-central-1.amazonaws.com | HTTPS |
| Middle East (Bahrain) | me-south-1 | config.me-south-1.amazonaws.com | HTTPS |
| Middle East (UAE) | me-central-1 | config.me-central-1.amazonaws.com | HTTPS |
| South America (São Paulo) | sa-east-1 | config.sa-east-1.amazonaws.com | HTTPS |
| AWS GovCloud (US-East) | us-gov-east-1 | config.us-gov-east-1.amazonaws.com | HTTPS |
| AWS GovCloud (US-West) | us-gov-west-1 | config.us-gov-west-1.amazonaws.com | HTTPS |

# AWS Config Process Checks Within a Conformance Pack for AWS Config

Process checks is a type of AWS Config rule that allows you to track your external and internal tasks that require verification as part of the conformance packs. These checks can be added to an existing conformance pack or a new conformance pack. You can track all compliance that includes AWS Configurations and manual checks in a single location.

With process checks, you can list the compliance of requirements and actions at a single location. These process checks help increase the coverage of compliance regimes-based conformance packs. You can further expand the conformance pack by adding new process checks that track processes and actions needing manual verification and tracking. This enables conformance pack to become the template that provides details about AWS Configurations and manual processes for a compliance regime.

You can track and manage the compliance of processes not associated with resource configuration changes within a conformance packs as process checks. For example, you can add a process check to track the PCI-DSS compliance requirement to store media backup at an offsite location. You will manually evaluate the compliance of this according to PCI-DSS guidelines, or according to your organization's guidance.

**Region availability**: Process checks with the conformance packs are available in all AWS Regions where AWS Config conformance packs are available. For more information, see Region Support.

- Sample Conformance Pack Template for Creating Process Checks
- Include Process Checks Within a Conformance Pack
- Change Compliance Status of a Process Check
- View and Edit the Process Check (Console)

## Sample Conformance Pack Template for Creating Process Checks

```
################################################################################
#
#  Conformance Pack template for process check
#
```

```
##############################################################################
Resources:
  AWSConfigProcessCheck:
    Properties:
      ConfigRuleName: RuleName
      Description: Description of Rule
      Source:
        Owner: AWS
        SourceIdentifier: AWS_CONFIG_PROCESS_CHECK
    Type: AWS::Config::ConfigRule
```

See two sample templates, the Operational Best Practices for CIS AWS Foundations Benchmark v1.4 Level 1 template and the Operational Best Practices for CIS AWS Foundations Benchmark v1.4 Level 2 template.

## Include Process Checks Within a Conformance Pack

1. Add a process check in the conformance pack template. Refer to Sample Conformance Pack Template for Creating Process Checks.

   ```
   Resources:
     ConfigEnabledAllRegions:
       Properties:
         ConfigRuleName: Config-Enabled-All-Regions
         Description: Ensure AWS Config is enabled in all Regions.
         Source:
           Owner: AWS
           SourceIdentifier: AWS_CONFIG_PROCESS_CHECK
       Type: AWS::Config::ConfigRule
   ```

2. Enter the name for the process check.
3. Enter the description for the process check.
4. Deploy the conformance pack. For more information, see Deploying Conformance Packs for AWS Config.

## Change Compliance Status of a Process Check

You can change the compliance status of a process check using the AWS Config console, the AWS CLI, and APIs.

### Change Compliance Status for Process Checks (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at https://console.aws.amazon.com/config/home.
2. Navigate to the AWS Config Rules page.
3. Choose the name of the process check that you specified in the template along with the identifier in the conformance pack.

   > **Note**
   >
   > All the process checks from the same conformance pack have the same suffix.

4. On the Rule details page, you cannot edit the rule but you can edit the compliance of the rule. In the Manual compliance section, choose **Edit compliance**.
5. Choose the appropriate compliance from the dropdown list.
6. (Optional) Enter a description for the compliance status.
7. Choose **Save**.

### Change the Compliance Status for Process Checks (AWS CLI)

You can update the compliance of process checks within a conformance pack using the AWS Command Line Interface (AWS CLI).

To install the AWS CLI on your local machine, see Installing the AWS CLI in the *AWS CLI User Guide*.

If necessary, type `AWS Configure` to configure the AWS CLI to use an AWS Region where AWS Config conformance packs are available.

1. Open a command prompt or a terminal window.
2. Enter the following command to update the compliance of a process check where `ComplianceResourceId` is your `Account ID`, and include the name of your rule.

```
aws configservice put-external-evaluation --config-rule-
name process-check-rule-name  --external-evaluation
 ComplianceResourceType=AWS::::Account,ComplianceResourceId=Account
 ID,ComplianceType=NON_COMPLIANT,OrderingTimestamp=2020-12-17T00:10:00.000Z
```

3. Press Enter to run the command.

Change the Compliance Status for Process Checks (API)

After the deployment is complete, to update the evaluations and compliance of the process checks, use the `PutExternalEvaluation` API. For more information, see PutExternalEvaluation.

## View and Edit the Process Check (Console)

You can view process checks only after a compliance state has been added to process checks. Choose the specific conformance pack to view all the process checks within that conformance pack. Here you can see a list of process checks that are in compliant and noncompliant status.

Because this is a service linked rule, you cannot edit the process check through the Rule details page.

> **Note**
>
> However, you can update the compliance of the process check by choosing **Edit Compliance** and selecting the appropriate value from Compliant, noncompliant or not applicable.

You can edit or delete a process check from the conformance pack where you added the process checks.

# Managed Conformance Packs for AWS Config

AWS Config managed conformance packs are predefined collections of AWS Config rules that are created and maintained by AWS. Managed conformance packs help you evaluate the configuration of your AWS resources against common security, operational, and compliance requirements without having to create and maintain your own conformance pack templates.

You can select a managed conformance pack and deploy it to an AWS account and Region. AWS defines the rules included in each managed conformance pack and maintains the pack as AWS Config rules and mapped requirements change.

To see the managed conformance packs that are available and the AWS Config rules included in each pack, see Managed Conformance Pack Catalog for AWS Config.

**Topics**

- How managed conformance packs work in AWS Config
- Managed Conformance Pack Catalog for AWS Config

## How managed conformance packs work in AWS Config

When you deploy a managed conformance pack, AWS Config deploys the AWS Config rules included in the pack to the selected AWS account and AWS Region. During deployment, you can configure the parameters for the rules in the managed conformance pack. If you don't specify a value for a parameter, AWS Config uses the default value for that parameter.

AWS Config uses the rules in the managed conformance pack to evaluate applicable resources and reports the results as part of the conformance pack. AWS Config recording must be enabled for the corresponding resource types for the rules to properly evaluate your resources. We recommend recording all supported resource types to maximize the benefits of managed conformance packs.

> **Note**
>
> Managed conformance packs are regionalized based on AWS Config rule availability. When you deploy a managed conformance pack to an AWS Region, AWS Config deploys only the rules in the pack that are supported in that Region. As a result, the rules included in a deployed managed conformance pack can vary by Region.

AWS maintains the content of managed conformance packs to keep them aligned with the requirements and best practices they are designed to address. AWS can add, update, or remove rules in response to changes such as updates to regulatory frameworks, the release of new AWS Config rules, or changes to AWS best practices. When AWS adds, updates, or removes rules from a managed conformance pack, you are notified via an Amazon CloudWatch Metric.

When AWS adds a new rule to a managed conformance pack, the rule is deployed to existing deployments of the managed conformance pack using the rule's default parameter values. New rules are evaluated automatically when they are created. When AWS updates an existing rule, for example by changing a parameter value, the rule is evaluated the next time it is successfully triggered.

You can't add or remove the rules included in a managed conformance pack. However, you can configure and update the supported parameters for the rules. If you need to control which rules are included in a conformance pack, create a custom conformance pack instead.

## Considerations

Before you deploy a managed conformance pack, consider the following:

- Managed conformance packs are deployed to an individual AWS account and Region. Deployment across an organization via Organization Conformance Packs isn't supported.
- You can't add or remove the rules included in a managed conformance pack.
- You can configure supported rule parameters when you deploy a managed conformance pack and update them after deployment. If you don't specify a parameter value, the default value is used.
- AWS maintains the content of managed conformance packs to keep them aligned with the requirements and best practices they are designed to address. AWS can add, update, or remove rules in response to changes such as updates to regulatory frameworks, the release of new AWS Config rules, or changes to AWS best practices. When AWS adds, updates, or removes rules from a managed conformance pack, you are notified via an Amazon CloudWatch Metric.
- New rules added to a managed conformance pack are deployed to existing deployments using their default parameter values.
- The rules deployed as part of a managed conformance pack can vary by Region based on AWS Config rule availability.
- AWS Config recording must be enabled for the corresponding resource types for rules to properly evaluate your resources. We recommend recording all supported resource types to maximize the benefits of managed conformance packs.
- Deploying a managed conformance pack can result in AWS Config rule evaluations and associated charges.

> **Important**
>
> Managed conformance packs can help you evaluate the configuration of your AWS resources against specified requirements. They don't guarantee compliance with any law, regulation, or industry standard. You are responsible for determining whether your use of AWS services meets applicable legal, regulatory, and compliance requirements.

### Next steps

- To review available managed conformance packs and the rules included in each pack, see Managed Conformance Pack Catalog for AWS Config.
- To deploy a managed conformance pack, see Deploying Conformance Packs for AWS Config.

## Managed Conformance Pack Catalog for AWS Config

The Managed Conformance Pack Catalog provides details about the managed conformance packs that are available in AWS Config. Managed conformance packs are predefined collections of AWS Config rules that are created and maintained by AWS. For more information, see How managed conformance packs work in AWS Config.

Each managed conformance pack includes AWS Config rules selected to help you evaluate your AWS resource configurations against the requirements or best practices represented by the pack. The catalog provides a description of each managed conformance pack and the AWS Config rules included in it.

> **Important**
>
> Managed conformance packs provide a general-purpose compliance framework to help you evaluate the configuration of your AWS resources against security, operational, or compliance requirements. Managed conformance packs, including those related to compliance standards and industry benchmarks, aren't designed to ensure your compliance with a specific governance standard. They don't replace your internal compliance efforts or guarantee that you will pass a compliance assessment.

> **Note**
>
> AWS Config automatically regionalizes managed conformance packs based on AWS Config rule availability. When you deploy a managed conformance pack to an AWS Region, only the rules in the pack that are supported in that Region are deployed. As a result, the rules deployed for a managed conformance pack can vary by Region.

### Managed conformance packs

## AWS Well-Architected Framework (WAF) v10

This AWS Config managed conformance pack provides a curated mapping between the AWS Well-Architected Framework best practices across all pillars and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more AWS Well-Architected Framework best practices. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** AWS-WAF_V10

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 334 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-internal-scheme-check | SEC05-BP01, SEC05-BP02 | Internal scheme configuration for Application Load Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | This configuration helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requirements that mandate network segmentation and controlled access to application infrastructure. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-listener-tagged | COST03-BP02, COST04-BP01 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibility and enable automated resource lifecycle management through tag-based policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | SUS02-BP03 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-branch-performance-mode-enabled | PERF04-BP05, PERF05-BP02, PERF06-BP02, PERF08-BP01, PERF08-BP05, SUS03-BP03 | Enabling performance mode on AWS Amplify branches optimizes application delivery by implementing advanced caching strategies, content compression, and edge optimization techniques. Performance mode reduces page load times, improves user experience, and can decrease bandwidth costs by serving optimized content from edge locations. Organizations should enable this feature to ensure their web applications meet performance standards and provide optimal user experiences across different geographic locations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | SEC08-BP02 | When caching is enabled, Amazon API Gateway service caches responses from API endpoint, reduces the number of calls made to an API endpoint and improves the latency of requests to the API. In addition, encrypted REST API caches protect data from unauthorized access. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | SEC04-BP01, SEC04-BP02 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | COST03-BP02, COST04-BP01 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | COST03-BP02, COST04-BP01 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | COST03-BP02, COST04-BP01 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | COST03-BP02, COST04-BP01 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | OPS05-BP03 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-replicate-to-ssm | SEC01-BP06 | Replicating AppConfig deployment strategies to Systems Manager documents provides centralized configuration management, enhanced auditability, and improved operational visibility. This practice enables teams to maintain consistent deployment patterns across environments, facilitates compliance reporting by creating auditable records of deployment configurations, and supports disaster recovery scenarios by ensuring deployment strategies are preserved in a managed service with built-in versioning and access controls. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | COST03-BP02, COST04-BP01 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | COST03-BP02, COST04-BP01 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | COST03-BP02, COST04-BP01 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | COST03-BP02, COST04-BP01 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | SEC05-BP01, SEC05-BP04 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | COST03-BP02, COST04-BP01 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | COST03-BP02, COST04-BP01 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | SEC09-BP02 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | SEC04-BP01 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | SEC05-BP01, SEC05-BP02 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | SEC05-BP01, SEC05-BP02 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | responsive applicati on environment. | |
| clb-multiple-az | PERF05-BP04, REL13-BP05 | Deploying AWS ELB's across multiple Availability Zones ensures availability of critical functions in the event of an AZ outage, or during regular maintenance, and allows organizat ions to maintain business operations. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cloudformation-sta ck-notification-check | REL06-BP03 | Sending event notifications to an SNS topic allows you to perform real time monitoring of your CloudForm ation stacks and proactively manage the provisioning and update process of AWS resources . CloudFormation stacks event notificat ions help identify unauthorized actions and ensure that AWS resources meet corporate standards and compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Spain), Israel (Tel Aviv), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-custom-ssl-certificate | SEC09-BP04 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | SEC08-BP04 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | SEC04-BP01, SEC04-BP02 | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-write-s3-data-event-check | SEC04-BP01, SEC04-BP02 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for write data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | if you configure a multi-Region trail that logs write-only or all types of data events for all S3 buckets. | |
| cloudtrail-s3-bucket-access-logging | SEC04-BP01 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudwatch-alarm-action-check | OPS04-BP05, OPS09-BP07, PERF07-BP04, REL11-BP06 | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-metric-stream-tagged | COST03-BP02, COST04-BP01 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources , tracking ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-cloud-watch-logs-enabled | OPS04-BP05 | Configuring CloudTrail to deliver logs to a CloudWatch Logs group centralizes log data in a single location simplifying log management providing a unified view of logs across multiple AWS accounts and regions, and provides real-time log monitoring and alerting capabilities, thus eliminating the need to access logs from different sources. CloudWatch Logs for CloudTrail logs can handle large volumes of log data without worrying about storage limitations, as CloudWatch Logs automatically scales to accommodate increasing log volumes, ensuring that log data is retained and accessible when needed. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | SEC04-BP01, SEC04-BP02 | CloudTrail provides critical visibility into account activity by recording AWS API calls and related events. Without CloudTrail enabled, organizations lose the ability to conduct security analysis, resource change tracking, and compliance auditing. This detective control identifies accounts lacking proper logging capabilit ies, which creates security blind spots that prevent effective incident investiga tion, complianc e verification, and detection of unauthorized activitie s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | SEC08-BP02, SEC08-BP03 | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cmk-backing-key-rotation-enabled | SEC08-BP01, SEC09-BP01 | Rotating KMS keys to reduce the risk of the key being compromised and prevent hackers from gaining access to your data and resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| codebuild-project-artifact-encryption | SEC08-BP02 | Ensure all artifacts within a CodeBuild project have encryption enabled for data at rest provides an extra layer of protectio n in the event of a security incident or unathorized access. This control operates by analyzing whether all of the artifacts inside of a CodeBuild project have encryption enabled. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-s3-logs-encrypted | SEC08-BP02 | Enforcing encryption on S3 logs generated by AWS CodeBuild projects protects the confidentiality and integrity of data. This control analyzies the settings and policies of the CodeBuild project and S3 bucket to ensure that encryption is enforced for logging. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| codebuild-report-group-encrypted-at-rest | SEC08-BP02 | Encrypting CodeBuild report groups is crucial for protecting sensitive build and test information. Unencrypted report data could be exposed if storage systems are compromised. Implementing encryption adds an essential layer of security for build and test results. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | COST03-BP02, COST04-BP01 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-auto-rollback-monitor-enabled | OPS06-BP08 | Auto rollback and monitoring helps ensure service continuity by automatically reverting failed deployments, reducing potential downtime and business impact. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-auto-rollback-enabled | REL11-BP07 | Auto rollback configuration in CodeDeploy deployment groups provides critical protection against failed deployments by automatically reverting to the previous working version when deployment failures or alarm thresholds are triggered. This capability minimizes application downtime, reduces the impact of problematic deployments, and ensures service availability. Without auto rollback enabled, failed deployments may require manual intervention to restore service, potentially leading to extended outages and degraded user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | OPS05-BP05 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-ec2-minimum-healthy-hosts-configured | REL11-BP02, REL11-BP07 | Maintaining a minimum number of healthy hosts during deployments is critical for application availability. Without this safeguard, deployments could potentially disrupt all instances simultaneously, causing service outages. Configuring minimum healthy hosts helps maintain service continuity during updates. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | SEC03-BP01 | Preventing unauthenticated access to Cognito Identity Pools is critical for maintaining security boundaries and implementing proper access controls. Allowing unauthenticated identities can expose AWS resources to unauthorized users, potentially leading to data breaches, resource abuse, or compliance violations. By monitoring and detecting Identity Pools with unauthenticated access enabled, organizations can ensure that all users are properly authenticated before receiving temporary AWS credentials, supporting defense-in-depth security strategies and regulatory compliance requirements. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-advanced-security-enabled | SEC02-BP01, SEC08-BP04 | Advanced security features in Cognito user pools are essential for protecting against unauthorized access and potential threats. Without these features, user accounts may be more vulnerable to attacks such as credential stuffing or brute force attempts. Enabling advanced security strengthens overall user authentication and access control. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Cognito user pools enables effective resource management, cost allocation, and governance oversight. Tags facilitate automated compliance reporting, support billing transparency across business units or projects, and enable consistent application of security policies. Without standardized tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in maintaining regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | SEC04-BP01 | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| custom-eventbus-policy-attached | SEC03-BP01 | Attaching a resource policy helps control access to custom EventBus resources , enforcing least privilege and reducing the risk of unauthorized access. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | SEC09-BP02 | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |
| datasync-task-logging-enabled | SEC04-BP01, SEC04-BP02 | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | SEC09-BP02, SEC09-BP04 | HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. You should only allow encrypted connections over TLS to access DAX clusters. However, encrypting data in transit can affect performance. You should test your application with encryption turned on to understand the performance profile and the impact of TLS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| db-instance-backup-enabled | REL09-BP01, REL09-BP03 | Failure to backup RDS instances can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuri ng backups to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-auto-minor-version-upgrade-check | OPS05-BP05 | Enabling automatic minor version upgrades for AWS Database Migration Service (DMS) ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | COST03-BP02, COST04-BP01 | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | accountability across database migration projects. | |
| dms-mongo-db-authentication-enabled | SEC08-BP04 | Enabling authentication for MongoDB endpoints is critical for maintaining data security during migrations. Without proper authentication, unauthorized access to sensitive data could occur. Implementing password-based authentication helps protect MongoDB data stores from unauthorized access and potential data breaches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-neptune-iam-authorization-enabled | SEC03-BP01 | IAM authentication for Neptune endpoints provides robust, scalable access control. Without IAM authentication, managing access to Neptune databases during migrations could be less secure and more complex. Implementing IAM authorization ensures fine-grained control over who can access Neptune data through DMS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-redis-tls-enabled | SEC09-BP02, SEC09-BP04 | TLS provides end-to-end security when data is sent between applications or databases over the internet. When you configure SSL encryption for your DMS endpoint, it enables encrypted communication between the source and target databases during the migration process. This helps prevent eavesdropping and interception of sensitive data by malicious actors. Without SSL encryption, sensitive data may be accessed, resulting in data breaches, data loss, or other security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-sourcedb-logging | SEC04-BP01 | Proper logging of DMS replication tasks is crucial for maintaining operational visibility and ensuring data integrity. Without adequate logging, issues in the replication process might go undetected, potentially leading to data inconsistencies. Configuring appropriate logging supports efficient troubleshooting and monitoring of migration processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-tagged | COST03-BP02, COST04-BP01 | Proper tagging of DMS replication tasks enables effective resource managemen t, cost allocatio n, and governanc e. Tags facilitate tracking of migration projects, identifying resource ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into their migration activities and cannot effective ly manage costs or apply security policies across their DMS infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted | SEC08-BP02 | Encrypting data at rest protects the confidentiality and integrity of data and reduces the risk of unauthorized access to data. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | SEC09-BP02, SEC09-BP04 | You can use TLS to encrypt the connection between an application and an Amazon DocumentDB cluster. Use of TLS can help protect data from being intercepted while the data is in transit between an application and an Amazon DocumentDB cluster. Encryption in transit for an Amazon DocumentDB cluster is managed using the TLS parameter in the cluster parameter group thats associated with the cluster. When encryption in transit is enabled, secure connections using TLS are required to connect to the cluster. We recommend using the following TLS parameters: tls1.2, tls1.3, and fips-140-3. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-in-backup-plan | REL09-BP01, REL09-BP03 | Failure to backup DynamoDB tables can result in a loss of mission critical data in the event of a failure or security incident. Enabling and properly configuring AWS Backup to match the organization's backup requirements is crucial to restore data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-last-backup-recovery-point-created | REL13-BP01 | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Amazon DynamoDB in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-pitr-enabled | REL09-BP01, REL09-BP03 | Implement point in time recovery risk mitigation measures to ensure your data is protected and can be restored to a specific point in the past whenever needed. This helps increase resiliency and availability of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-resources-protected-by-backup-plan | REL09-BP01, REL09-BP03 | Failure to backup DynamoDB tables can result in a loss of mission critical data in the event of a failure or security incident. Enabling and properly configuring AWS Backup to match the organization's backup requirements is crucial to restore data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-table-encrypted-kms | SEC08-BP02 | Encryption of data at rest in DynamoDB is enabled by default. Using AWS KMS reduces the operational complexity of managing encryption keys by integrating transparently with DynamoDB. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ebs-in-backup-plan | REL09-BP01, REL09-BP03 | Failure to backup EBS volumes can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for the continuity of operations and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-last-backup-recovery-point-created | REL13-BP01 | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Amazon Elastic Block Store (EBS) volumes in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-resources-in-logically-air-gapped-vault | SEC01-BP01 | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-protected-by-backup-plan | REL09-BP01, REL09-BP03 | Failure to backup EBS volumes can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for the continuity of operations and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-snapshot-public-restorable-check | SEC05-BP01, SEC05-BP02 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EC2 carrier gateways is essential for resource managemen t, cost allocatio n, access control, operational visibilit y. Tags enable organizations to categorize track network infrastru cture component s, implement automated governance policies, maintain complianc e with organizat ional standards. Consistent tagging practices facilitat e resource identific ation, billing attributi on, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-ebs-encryption-by-default | SEC08-BP02, SEC08-BP03 | Sensitive data can exist at rest on EBS volumes. All sensitive data should be protected at rest using strong cryptography, to protect the confidentiality and integrity of information and prevent and protect data in storage. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | SEC05-BP01, SEC05-BP02 | Source/destination check is a critical security feature that ensures network interfaces can only send receive traffic that is specifically destined for or originates from the interface. Disabling this check without proper justification can create security vulnerabilities by allowing traffic forwarding potential network bypasses. Monitoring this setting helps maintain network security boundaries, prevents unauthorized traffic routing, ensures compliance with network security policies. This control is particularly important for maintaining the integrity of network traffic flows preventing potential security misconfigurations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | SEC01-BP06 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-profile-attached | COST02-BP04 | Attaching IAM profiles to EC2 instances allows you to manage permissions and follow the principle of least privilege to prevent unauthorized access to your resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-last-backup-recovery-point-created | REL13-BP01 | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Elastic Compute Cloud (EC2) instances in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ec2-launch-template-imdsv2-check | REL06-BP01, SEC06-BP02 | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-patch-compliance-status-check | OPS05-BP05, SEC06-BP01 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-in-logically-air-gapped-vault | SEC01-BP01 | Logical air-gapping is essential for protecting critical compute resources from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive systems. Implementing air-gapping provides an additional security barrier for critical EC2 instances. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-protected-by-backup-plan | REL09-BP01, REL09-BP03 | Amazon EC2 backup on AWS involves creating snapshots of your EC2 instances and their attached EBS volumes. These snapshots capture the instance's data at a specific point in time, allowing you to create reliable backups and recover instances in case of data loss or system failures. By utilizing EC2's snapshot and AMI (Amazon Machine Image) features, you can efficiently manage and restore your instances and their data. Not backing up EC2 instances exposes your data to potential loss in the event of hardware failures, accidental deletions, or software errors. Without backups, recovery becomes challenging and time-consuming, risking | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | downtime and data integrity. Regular backups are crucial to mitigate these risks and ensure business continuity. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | SEC08-BP02, SEC08-BP03 | For an additional layer of security, you should enable encryption for Amazon EBS volumes. Encryption operations then occur on the servers that host Amazon EC2 instances, which helps ensure the security of both data at rest and data in transit between an instance and its attached EBS storage. Amazon EBS encryption is a straightforward encryption solution for EBS resources associated with your EC2 instances. With EBS encryption, you arent required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | SEC04-BP01 | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | COST03-BP02, COST04-BP01 | Proper tagging of VPN connections enables effective resource managemen t, cost allocatio n, governance oversight. Tags facilitate automated operations, security policies, complianc e reporting by providing metadata that identifies resource ownership, purpose, environme nt, other critical attributes. Consisten t tagging practices improve operation al visibility support organizational policies for resource lifecycle managemen t. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | SEC06-BP01 | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabilities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-lifecycle-policy-configured | SUS04-BP03 | Amazon ECR lifecycle policies provide more control over the lifecycle managemen t of images in a private repositor y to automate the cleaning up of your container images by expiring images based on age or count and maintain a strong security posture. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | COST03-BP02, COST04-BP01 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | COST03-BP02, COST04-BP01 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | SEC05-BP01, SEC05-BP02 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | REL09-BP01, REL09-BP03 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-encrypted-check | SEC08-BP02 | Encrypting data at rest on EFS protects data from unauthorized access, reduces the risk of potential data breaches, and meets compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-filesystem-ct-encrypted | SEC08-BP02 | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryptio n, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| efs-in-backup-plan | REL09-BP03 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-last-backup-recovery-point-created | REL13-BP01 | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Amazon Elastic File System (EFS) file systems in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| efs-resources-in-logically-air-gapped-vault | SEC05-BP01 | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). | emr-security-configuration-encryption-transit | SEC09-BP02 | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data processing workloads. | |
| encrypted-volumes | SEC08-BP02 | Encrypting data at rest on EBS volumes facilitates protectio n of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| evidently-launch-t agged | COST03-BP02, COST04-BP01 | Tagging Evidently launches is crucial for maintaining operational visibilit y and resource management. Proper tagging enables effective resource tracking, cost allocation, and access control. Without structured tagging, organizations may struggle to manage and monitor their feature launches effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Evidently projects is essential for maintaining project organization and visibility. Tags enable effective resource management, cost tracking, and access control. Without structured tagging, organizations risk losing oversight of their experimentation projects. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| evidently-segment-tagged | COST03-BP02, COST04-BP01 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentat ion. Proper tagging enables efficient resource managemen t, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | SEC04-BP01 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | COST03-BP02, COST04-BP01 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-entity-type-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Fraud Detector entity types is essential for maintaining operational visibilit y and control. Tags facilitate effective resource managemen t, cost tracking, and access control implementation. Without structured tagging, organizat ions risk losing oversight of their fraud detection infrastructure and associated resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-label-tagged | COST03-BP02, COST04-BP01 | Tagging Fraud Detector labels is crucial for maintaining clear visibility and control over fraud detection configurations. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and analyze their fraud detection labels. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-outcome-tagged | COST03-BP02, COST04-BP01 | Tagging Fraud Detector outcomes is essential for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their fraud detection outcomes and associated analysis capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-variable-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Fraud Detector variables is crucial for maintaining clear visibility and control over fraud detection configurations. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may face challenges in managing and analyzing their fraud detection variables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | REL13-BP01, REL13-BP02 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | COST03-BP02, COST04-BP01 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-resources-protected-by-backup-plan | REL09-BP01, REL09-BP03 | Failure to backup Amazon FSx file systems can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | SEC04-BP01 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | SEC04-BP01, SEC04-BP02 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | SEC08-BP02, SEC08-BP03 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | SEC04-BP02 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | SEC04-BP02 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon ECS clusters on AWS Fargate. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-audit-enabled | SEC04-BP01, SEC04-BP02 | EKS Audit Log Monitoring is crucial for maintaining security visibility in Kubernetes environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilities for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | SEC04-BP01, SEC04-BP04, SEC05-BP03, SEC09-BP03 | EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | SEC04-BP03, SEC04-BP04, SEC05-BP03, SEC05-BP04 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | SEC01-BP04, SEC04-BP04, SEC05-BP03 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Lambda Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Lambda Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | SEC01-BP08, SEC04-BP04, SEC06-BP01 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Malware Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Malware Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | SEC01-BP04, SEC04-BP04, SEC05-BP03 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the RDS Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty RDS Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | SEC04-BP02 | In a multi-account environment, only the delegated GuardDuty administrator can enable or disable GuardDuty Runtime Monitoring for accounts in their organization. In addition, only the GuardDuty administrator can configure and manage the security agents that GuardDuty uses for runtime monitoring of AWS workloads and resources for accounts in the organization. GuardDuty member accounts cant enable, configure, or disable Runtime Monitoring for their own accounts. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | SEC01-BP04, SEC05-BP03 | S3 Protection is essential for maintaining security visibility over storage resources. Without this feature, organizations may miss potential security threats targeting their S3 buckets. Enabling S3 Protection enhances threat detection capabilities for storage environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| iam-external-access-analyzer-enabled | SEC03-BP07, SEC03-BP09, SEC08-BP04 | External access analysis is crucial for maintaining security control over AWS resources. Without Access Analyzer, organizations may have difficulty identifying unintended external access to their resources. Implementing external access analysis helps prevent unauthorized resource exposure. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | COST03-BP02, COST04-BP01 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | SEC02-BP01 | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | COST02-BP04, SEC03-BP02, SEC03-BP04, SEC03-BP05 | The AWSCloudShellFullAccess managed policy grants broad permissions, including unrestricted file upload and download through AWS CloudShell, which can be used to exfiltrate data or introduce files into the environment. Attaching this policy violates least-privilege principles; grant only the specific CloudShell permissions required so the risk of data exfiltration and misuse is minimized. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | SEC03-BP02 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | SEC01-BP02 | Root user should not routinely access the AWS account. The access key for your AWS account root user gives full access to all your resources for all AWS services, including your billing informati on. You can't reduce the permissions associated with your AWS account root user access key. This helps to minimize potential unwanted or even unauthori zed changes to the environment, which could result in a negative impact to the business. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | COST03-BP02, COST04-BP01 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | SEC09-BP01 | Expired SSL/TLS server certificates left in IAM can be inadvertently associated with resources, causing failed or insecure connections and weakening trust in the certificate chain. Promptly removing expired certificates reduces the risk of outages and of clients negotiating connections with invalid credentials, and keeps the certificate inventory accurate. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | COST03-BP02, COST04-BP01 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-mfa-enabled | SEC02-BP01 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | COST02-BP04, SEC03-BP02 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | SEC06-BP01 | EC2 security scanning is crucial for maintaining strong security posture of compute resources . Without regular scanning, organizat ions may be unaware of vulnerabilities in their EC2 instances . Implementing automated scanning helps identify and address security weaknesses. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Canada West (Calgary) , Europe (Spain), Mexico (Central) , and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-ecr-scan-enabled | SEC06-BP01 | Container image scanning is essential for maintaining security in container ized environments. Without regular scanning, organizat ions may deploy containers with known vulnerabi lities. Implement ing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Canada West (Calgary) , Europe (Spain), Mexico (Central) , and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-code-scan-enabled | SEC06-BP01 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| inspector-lambda-standard-scan-enabled | SEC11-BP02 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | COST03-BP02, COST04-BP01 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). | --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | COST03-BP02, COST04-BP01 | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | SEC02-BP01 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | COST03-BP02, COST04-BP01 | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ivs-channel-playback-authorization-enabled | SEC03-BP02 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | SEC08-BP02 | Server-side encryption is a feature in Amazon Data Firehose delivery streams that automatically encrypts data before its at rest by using a key created in AWS Key Management Service (AWS KMS). Data is encrypted before its written to the Data Firehose stream storage layer, and decrypted after its retrieved from storage. This allows you to comply with regulatory requirements and enhance the security of your data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-stream-encrypted | SEC08-BP02 | Ensuring encryption is enabled for Kinesis data streams at rest reduces the likelihood of unintentional data exposure and reduces the risk of a data breach. Server side encryption is available in Kineses to perform this function. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-cmk-not-scheduled-for-deletion | SEC08-BP01, SEC09-BP01 | KMS keys cannot be recovered if deleted and any data which has been encrypted by that KMS key will be unrecoverable leading to business loss of data. If meaningful data has been encrypted under a KMS key scheduled for deletion, consider decrypting the data or re-encrypting the data under a new KMS key unless you are intentionally performing a cryptographic erasure. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | SEC03-BP01 | A publicly accessible AWS KMS key policy allows principal s outside your organization to use the key for cryptographic operations, which can lead to unauthori zed decryption of protected data or unsanctioned encryption. Restricti ng the key policy to specific trusted principals enforces least privilege and protects the confidentiality of data encrypted with the key. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | COST03-BP02, COST04-BP01 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | OPS04-BP02, OPS08-BP03, PERF07-BP01 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | COST03-BP02, COST04-BP01 | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-certificate-tagged | COST03-BP02, COST04-BP01 | Tagging Lightsail certificates enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking certificate ownership, purpose, and lifecycle management. Consistent tagging practices improve operational visibility, facilitate automated management tasks, and support compliance requirements by ensuring all SSL/TLS certificates can be properly identified and categorized within the infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-disk-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Lightsail disks enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support complianc e requirements for asset identification. Without consistent tagging, organizat ions lose visibility into resource utilizati on, struggle with cost attribution, and face challenge s in implement ing automated management workflows. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| macie-auto-sensitive-data-discovery-check | SEC07-BP03 | Amazon Macie uses machine learning to detect sensitive data like personally identifiable informati on (PII). Enabling Amazon Macie monitors for and prevents unauthori zed exposure of sensitive data, reducing compliance risks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | SEC02-BP01 | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | SEC02-BP04 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-single-instance-broker-storage-type-efs | REL09-BP01 | Using EFS storage type for Amazon MQ ActiveMQ single-instance brokers provides enhanced durability, availability, and performance characteristics compared to other storage options. EFS offers automatic scaling, built-in redundancy across multiple Availability Zones, and better integration with AWS backup and recovery services. This storage configuration helps ensure message persistence, reduces the risk of data loss during broker failures, and supports better disaster recovery capabilities for messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-auto-minor-version-upgrade-enabled | OPS05-BP05 | As Amazon MQ releases and supports new broker engine versions, the changes are backward-compatible with an existing application and dont deprecate existing functionality. Automatic broker engine version updates protect you against security risks, help fix bugs, and improve functionality. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | SEC04-BP01 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-log-enabled | SEC04-BP01 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | SEC03-BP02, SEC05-BP02, SEC08-BP04 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | SEC05-BP01, SEC05-BP02 | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-cluster-tagged | COST03-BP02, COST04-BP01 | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | SEC04-BP01 | Enabling logging for MSK Connect connectors is essential for operational visibility, troubleshooting, and security monitoring. Logs provide critical insights into connector performance, data processing activities, error conditions, and potential security events. Without proper logging, organizations lose the ability to effectively monitor data pipeline operations, diagnose issues, meet compliance requirements for audit trails, and detect suspicious activities or data processing anomalies. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-enhanced-monitoring-enabled | PERF07-BP01, PERF07-BP04 | Enhanced monitoring is crucial for maintaining operational visibility and performance of Kafka clusters. Without detailed monitoring, organizations may miss critical performance issues or capacity problems. Implementing enhanced monitoring supports better cluster management and troubleshooting. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | SEC02-BP01, SEC03-BP01, SEC03-BP02 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | SEC04-BP01 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-backup-retention-check | REL09-BP03 | Backups help to recover more quickly from a security incident and strengthen the resilience of the systems. Automating backups for Amazon Neptune DB clusters, enables to restore systems to a point in time, and minimize downtime and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | SEC08-BP02 | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-multi-az-enabled | REL10-BP01, REL11-BP02 | Multi-AZ configuration is essential for maintaining database availability and data resilience. Without Multi-AZ, Neptune clusters are vulnerable to single points of failure. Implementing Multi-AZ replication enhances database reliability and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-encrypted | SEC08-BP02 | Enabling encryption at rest for Amazon Neptune DB cluster snapshots protects the data against unauthorized access to sensitive data, and helps achieve compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | SEC03-BP05, SEC05-BP02, SEC05-BP04 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewalls subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-cross-zone-load-balancing-enabled | REL10-BP01, REL10-BP02, REL11-BP02 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | SEC05-BP01, SEC05-BP02 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | SEC04-BP01 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | COST03-BP02, COST04-BP01 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | REL10-BP02 | Configuring OpenSearch domains with at least three data nodes and multi-AZ enabled enhances availability, fault tolerance, scalability, performance, data resilience, and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). | rds-mariadb-instance-encrypted-in-transit | SEC09-BP02 | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | SEC09-BP02 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | COST03-BP02, COST04-BP01 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | SEC04-BP01, SEC04-BP02 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | SEC09-BP02 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | SEC09-BP02 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-resources-protected-by-backup-plan | REL09-BP01, REL09-BP03 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-snapshot-encrypted | SEC08-BP02 | Enabling encryption at rest for RDS cluster snapshots and RDS database protects your data against unauthorized access to sensitive data and helps achieve compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | SEC09-BP02 | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | SEC04-BP01, SEC04-BP02 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | SEC08-BP02 | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | REL10-BP01, REL10-BP02, REL11-BP02 | Multi-Availability Zone deployment for Amazon Redshift clusters provides enhanced availability and fault tolerance by maintaining a standby cluster in a separate Availability Zone. This configuration ensures business continuity during infrastructure failures, planned maintenance activities, or Availability Zone outages. Multi-AZ deployments reduce the risk of data warehouse downtime and help meet high availability requirements for critical analytics workloads and business intelligence applications. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-subnet-group-multi-az | REL10-BP01, REL10-BP02, REL11-BP02 | Configuring a Redshift cluster subnet group with subnets in more than one Availability Zone allows the cluster to be provisioned or recovered across AZs. This improves availability and resilience and reduces the risk that a single AZ disruption makes the data warehouse unavailable. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-require-tls-ssl | SEC09-BP04 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | SEC04-BP01 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | SEC09-BP02 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | SEC05-BP01, SEC05-BP02 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | SEC05-BP01, SEC05-BP02 | Routing Redshift Serverless workgroup traffic through a VPC provides essential network isolation and security controls. VPC routing enables organizations to implement network-level access controls, monitor traffic patterns, and maintain compliance with security frameworks that require private network configurations. This control helps prevent unauthorized external access to data warehouse resources and ensures that sensitive data processing occurs within a controlled network environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-unrestricted-port-access | SEC05-BP02, SEC08-BP04 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implementing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| required-tags | COST04-BP01 | Tags can help you manage, identify, organize, search for, and filter resources. Tagging can also be used to create new resource constructs for visibility or control (such as grouping together resources that make up a micro-service, application, or workload). Tagging is fundamental to providing enterprise-level visibility and control. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | SEC02-BP01 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentials making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | SEC02-BP01 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-in-vpc-only | SEC05-BP02, SEC08-BP04 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-access-point-public-access-blocks | SEC08-BP04 | Enabling block public access for Amazon S3 access points enhances security by preventing unauthorized access from the public internet, mitigating the risk of data breaches, and ensuring compliance with security best practices and regulatory requirements. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks | SEC05-BP02, SEC08-BP04 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks-periodic | SEC05-BP02, SEC08-BP04 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-cross-region-replication-enabled | REL10-BP01, REL11-BP02 | Cross-Region Replication is essential for maintaining data availability and disaster recovery capabilities. Without replication, organizations risk data loss in case of region-wide outages. Implementing Cross-Region Replication enhances data durability and supports business continuity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-default-lock-enabled | SEC08-BP04 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | SEC05-BP02, SEC08-BP04 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-logging-enabled | SEC04-BP01 | Enabling S3 bucket logging on target S3 buckets allows you to capture all events that might affect objects in a target bucket. Configuring logs to be placed in a separate bucket enables access to log information, which can be useful in security and incident response workflows and provides redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-public-read-prohibited | SEC03-BP02, SEC05-BP02, SEC08-BP04 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | SEC03-BP02, SEC05-BP02, SEC08-BP04 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | SEC08-BP02 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-ssl-requests-only | SEC09-BP04 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-tagged | COST03-BP02, COST04-BP01 | Tagging S3 buckets is essential for effective resource management, cost allocation, and governance. Tags enable organizations to categorize buckets by purpose, owner, environment, or project, facilitating accurate cost tracking and billing. Proper tagging also supports automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | SEC08-BP04 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and applicati on failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanent ly, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encrypt ion-kms | SEC08-BP02, SEC08-BP03 | Protecting objects in S3 using encryptio n at rest with KMS prevents unauthori zed access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-last-backup-recovery-point-created | REL13-BP01, REL13-BP02 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | SUS04-BP03 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | REL09-BP03 | Performing data backups is critical to a disaster recovery plan. Data is vulnerable to hardware or software malfunctions or data corruption, cyberattacks, accidental deletion, calamities, and more. Ensuring that data is backed up will mitigate the forementioned risks. IMPORTANT NOTE: You must enable S3 Versioning on your S3 bucket to use AWS Backup for Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | SUS04-BP03 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | SEC05-BP01, SEC05-BP02 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | COST03-BP02, COST04-BP01 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-configuration-kms-key-configured | SEC08-BP02 | Enabling encryption with AWS KMS protects data at rest in Amazon SageMaker, making it difficult for unauthorized individuals to access or manipulate the data. AWS KMS provides centralized key management, facilitating the management of keys and their lifecycle. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| sagemaker-endpoint-config-prod-instance-count | REL10-BP01, REL10-BP02 | Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architecture. High availability helps you to recover from security incidents. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | COST03-BP02, COST04-BP01 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | SEC05-BP01, SEC05-BP02 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | SEC05-BP01, SEC05-BP02 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-kms-key-configured | SEC08-BP02 | Sensitive information can be stored on the storage volumes attached to Amazon SageMaker notebook instance. Amazon KMS key ensures that the data at rest is encrypted. Encryption of data-at-rest is a recommended best practice to add a layer of access management around your data. In case of any compromise to your SageMaker resources, encryption-at-rest ensures that you data is protected from unintended access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| secretsmanager-rotation-enabled-check | SEC02-BP03 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| secretsmanager-scheduled-rotation-success-check | SEC02-BP03 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-secret-periodic-rotation | SEC02-BP03 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | SEC04-BP03, SEC04-BP04 | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| shield-drt-access | SEC10-BP05 | The Shield Response Team (SRT) provides added support with security engineers who specialize in DDoS event response. As an additional layer of support to your AWS Support plan, you can work directly with the SRT, leveraging their expertise as part of your event response workflow. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| sns-encrypted-kms | SEC08-BP02 | Encrypting data at rest reduces the risk of data stored on disk being accessed by unauthenticated users. This adds a data protection layer from a threat actor attempting to gain unauthorized access to SNS topic data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | SEC05-BP02, SEC08-BP04 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | SEC03-BP02, SEC08-BP04 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | based application architectures. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | SEC03-BP02, SEC08-BP04 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | SEC03-BP01, SEC03-BP02, SEC08-BP04 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | SEC04-BP01 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-document-not-public | SEC06-BP02 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | COST03-BP02, COST04-BP01 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | REL13-BP01, REL13-BP02 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| storagegateway-resources-protected-by-backup-plan | REL09-BP01 | Ensuring AWS Storage Gateway volumes and file shares are included in a backup plan allows for recovery of data in the event of loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-connector-logging-enabled | SEC04-BP01, SEC04-BP02 | Enabling CloudWatch logging for an AWS Transfer Family connector records file-transfer activity and errors that are essential for monitoring, troubleshooting, and investigating unauthorized or anomalous transfers. Without these logs, malicious activity can go undetected and forensic analysis is limited. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | SEC09-BP02 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-last-backup-recovery-point-created | REL13-BP01, REL13-BP02 | Regular recovery point creation is crucial for maintaining virtual machine data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of VM failures. Implementing regular backups provides a reliable mechanism for virtual machine protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-in-logically-air-gapped-vault | REL13-BP01, REL13-BP02 | Regular recovery point creation is crucial for maintaining volume data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of volume failures. Implementing regular backups provides a reliable mechanism for volume protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-protected-by-backup-plan | REL09-BP03 | Ensuring EC2 instances are included in a backup plan allows for recovery of instance data and applications in the event of loss or corruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | SEC05-BP01, SEC05-BP02, SEC05-BP04 | Security groups provide stateful filtering of ingress and egress network traffic to AWS resources. We recommend that no security group allow unrestricted ingress access to remote server administration ports, such as SSH to port 22 and RDP to port 3389, using either the TDP (6), UDP (17), or ALL (-1) protocols. Permitting public access to these ports increases resource attack surface and the risk of resource compromise. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-not-empty | SEC05-BP04 | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| wafv2-webacl-not-empty | SEC05-BP04 | Web access control lists (ACLs) without any configured rules or rule groups will not perform traffic inspection or filtering, allowing all web traffic to pass through unchecked. Configuring rules or rule groups enables enforcement of web application security policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| waf-global-rulegroup-not-empty | SEC05-BP04 | AWS Web Application Firewall (WAF) Classic global rule groups, without any configured rules, will not inspect or filter web traffic, potentially allowing malicious or unauthorized traffic to pass through. Configuring rules enables traffic inspection and enforcement of security policies. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-rule-not-empty | SEC05-BP04 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-webacl-not-empty | SEC05-BP04 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | COST03-BP02, COST04-BP01 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| workspaces-workspace-tagged | COST03-BP02, COST04-BP01 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## AWS Well-Architected Framework (WAF) v10 - Cost Optimization Pillar

This AWS Config managed conformance pack provides a curated mapping between the AWS Well-Architected Framework Cost Optimization pillar best practices and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more AWS Well-Architected Framework best practices. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** AWS-WAF_V10_COST-OPTIMIZATION

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 75 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-listener-tagged | COST03-BP02, COST04-BP01 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | practices improve operational visibilit y and enable automated resource lifecycle managemen t through tag-based policies. | available in the AWS GovCloud (US) Regions. |
| alb-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting . Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining operational visibilit y across environme nts. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | COST03-BP02, COST04-BP01 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | COST03-BP02, COST04-BP01 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | COST03-BP02, COST04-BP01 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | COST03-BP02, COST04-BP01 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | COST03-BP02, COST04-BP01 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | COST03-BP02, COST04-BP01 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | COST03-BP02, COST04-BP01 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | COST03-BP02, COST04-BP01 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | COST03-BP02, COST04-BP01 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | COST03-BP02, COST04-BP01 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | COST03-BP02, COST04-BP01 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | COST03-BP02, COST04-BP01 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | COST03-BP02, COST04-BP01 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | COST03-BP02, COST04-BP01 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-metric-stream-tagged | COST03-BP02, COST04-BP01 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources , tracking ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | COST03-BP02, COST04-BP01 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Cognito user pools enables effective resource management, cost allocation, and governance oversight. Tags facilitate automated compliance reporting, support billing transparency across business units or projects, and enable consistent application of security policies. Without standardized tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in maintaining regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | COST03-BP02, COST04-BP01 | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | accountability across database migration projects. | |
| dms-replication-task-tagged | COST03-BP02, COST04-BP01 | Proper tagging of DMS replication tasks enables effective resource managemen t, cost allocatio n, and governanc e. Tags facilitate tracking of migration projects, identifying resource ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into their migration activities and cannot effective ly manage costs or apply security policies across their DMS infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EC2 carrier gateways is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize track network infrastructure components, implement automated governance policies, maintain compliance with organizational standards. Consistent tagging practices facilitate resource identification, billing attribution, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-profile-attached | COST02-BP04 | Attaching IAM profiles to EC2 instances allows you to manage permissio ns and follow the principle of least privilege to prevent unauthorized access to your resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Network Insights access scopes enables effective resource management, cost allocation, governance across AWS environments. Tags provide essential metadata for tracking resource ownership, purpose, lifecycle management. Consistent tagging practices support automated operations, security policies, compliance reporting requirements. Without adequate tagging, organizations lose visibility into resource utilization patterns struggle to implement effective cost controls access management policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-path-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Network Insights paths enables effective resource management, cost allocation, operational governance. Tags facilitate automated resource discovery, support compliance reporting requirements, enable consistent application of organizational policies across network analysis resources. Without standardized tagging, organizations lose visibility into resource ownership, purpose, associated costs, making it difficult to maintain operational control meet regulatory requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | COST03-BP02, COST04-BP01 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-tagged | COST03-BP02, COST04-BP01 | Proper tagging of VPN connections enables effective resource managemen t, cost allocatio n, governance oversight. Tags facilitate automated operations, security policies, complianc e reporting by providing metadata that identifies resource ownership, purpose, environme nt, other critical attributes. Consisten t tagging practices improve operation al visibility support organizational policies for resource lifecycle managemen t. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | COST03-BP02, COST04-BP01 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | COST03-BP02, COST04-BP01 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | COST03-BP02, COST04-BP01 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operational visibility. Tags enable organizations to categorize track add-ons by environment, owner, project, or cost center, facilitating accurate billing resource governance. Consistent tagging practices support automated management workflows, security policies, compliance reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernetes infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| elasticache-rbac-auth-enabled | COST02-BP04 | RBAC authentication provides fine-grained access control for Redis clusters. Without RBAC, managing access to cache resources could be less secure and more difficult to maintain. Implementing RBAC ensures proper authentication and authorization for cache access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-launch-tagged | COST03-BP02, COST04-BP01 | Tagging Evidently launches is crucial for maintaining operational visibility and resource management. Proper tagging enables effective resource tracking, cost allocation, and access control. Without structured tagging, organizations may struggle to manage and monitor their feature launches effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| evidently-project-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Evidently projects is essential for maintaining project organization and visibility. Tags enable effective resource management, cost tracking, and access control. Without structured tagging, organizations risk losing oversight of their experimentation projects. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| evidently-segment-tagged | COST03-BP02, COST04-BP01 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentation. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | COST03-BP02, COST04-BP01 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-entity-type-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Fraud Detector entity types is essential for maintaining operational visibilit y and control. Tags facilitate effective resource managemen t, cost tracking, and access control implementation. Without structured tagging, organizat ions risk losing oversight of their fraud detection infrastructure and associated resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-label-tagged | COST03-BP02, COST04-BP01 | Tagging Fraud Detector labels is crucial for maintaining clear visibility and control over fraud detection configurations. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and analyze their fraud detection labels. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-outcome-tagged | COST03-BP02, COST04-BP01 | Tagging Fraud Detector outcomes is essential for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their fraud detection outcomes and associated analysis capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-variable-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Fraud Detector variables is crucial for maintaining clear visibility and control over fraud detection configurations. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may face challenges in managing and analyzing their fraud detection variables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| msk-cluster-tagged | COST03-BP02, COST04-BP01 | Proper tagging of MSK clusters is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitating automated governance policies and billing analysis. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain compliance with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | COST03-BP02, COST04-BP01 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | COST03-BP02, COST04-BP01 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | COST03-BP02, COST04-BP01 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| required-tags | COST04-BP01 | Tags can help you manage, identify, organize, search for, and filter resources. Tagging can also be used to create new resource construct s for visibility or control (such as grouping together resources that make up a micro-service, application, or workload). Tagging is fundamental to providing enterpris e-level visibility and control. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-tagged | COST03-BP02, COST04-BP01 | Tagging S3 buckets is essential for effective resource managemen t, cost allocation, and governance. Tags enable organizat ions to categorize buckets by purpose, owner, environment, or project, facilitat ing accurate cost tracking and billing. Proper tagging also supports automated resource managemen t, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | COST03-BP02, COST04-BP01 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | COST03-BP02, COST04-BP01 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | COST03-BP02, COST04-BP01 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | COST03-BP02, COST04-BP01 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | COST03-BP02, COST04-BP01 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | COST03-BP02, COST04-BP01 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## AWS Well-Architected Framework (WAF) v10 - Operational Excellence Pillar

This AWS Config managed conformance pack provides a curated mapping between the AWS Well-Architected Framework Operational Excellence pillar best practices and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more AWS Well-Architected Framework best practices. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** AWS-WAF_V10_OPERATIONAL-EXCELLENCE

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 17 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | OPS05-BP03 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | application failures, security vulnerabi lities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configura tions to production environments. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | OPS04-BP01 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appsync-logging-enabled | OPS04-BP01 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | OPS05-BP05 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| cloudwatch-alarm-action-check | OPS04-BP05, OPS09-BP07 | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-cloud-watch-logs-enabled | OPS04-BP05 | Configuring CloudTrail to deliver logs to a CloudWatch Logs group centralizes log data in a single location simplifying log management providing a unified view of logs across multiple AWS accounts and regions, and provides real-time log monitoring and alerting capabilities, thus eliminating the need to access logs from different sources. CloudWatch Logs for CloudTrail logs can handle large volumes of log data without worrying about storage limitations, as CloudWatch Logs automatically scales to accommodate increasing log volumes, ensuring that log data is retained and accessible when needed. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-auto-rollback-monitor-enabled | OPS06-BP08 | Auto rollback and monitoring helps ensure service continuity by automatically reverting failed deployments, reducing potential downtime and business impact. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | OPS05-BP05 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-auto-minor-version-upgrade-check | OPS05-BP05 | Enabling automatic minor version upgrades for AWS Database Migration Service (DMS) ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | OPS05-BP05 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-auto-minor-version-upgrade-check | OPS05-BP05 | Enabling automatic minor version upgrades for Amazon ElastiCache ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Melbourne), Canada West (Calgary), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | OPS08-BP03 | Enhanced health reporting in Elastic Beanstalk provides deeper visibility into application health status beyond basic instance health checks. This capability monitors additional metrics including CPU utilization, application latency, and request rates, enabling more effective troubleshooting and faster incident response. Without enhanced health reporting, organizations may experience delayed detection of performance degradation, potentially resulting in extended service disruptions and negative impact on application availability. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-managed-updates-enabled | OPS05-BP05 | Automatically applying managed patches in Elastic Beanstalk ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | OPS04-BP02, OPS08-BP03 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-auto-minor-version-upgrade-enabled | OPS05-BP05 | As Amazon MQ releases and supports new broker engine versions, the changes are backward-compatible with an existing application and dont deprecate existing functionality. Automatic broker engine version updates protect you against security risks, help fix bugs, and improve functionality. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-automatic-minor-version-upgrade-enabled | OPS05-BP05 | AWS RDS will occasionally deprecate minor engine versions and provide new ones for an upgrade. When the last version number within the release is replaced, the version changed is considered minor. With Auto Minor Version Upgrade feature enabled, the version upgrades will occur automatically during the specified maintenance window so your RDS instances can get the new features, bug fixes, and security patches for their database engines. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-auto-minor-version-upgrade-enable | OPS05-BP05 | Keeping Amazon Relational Database Service (RDS) clusters up-to-date with the latest minor database engine version ensures timely application of security patches and bug fixes released by AWS. This reduces the possible risk of known vulnerabilities being exploited and maintains a secure and stable database environment. | Available in all commercial Regions except US West (N. California), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

## AWS Well-Architected Framework (WAF) v10 - Performance Efficiency Pillar

This AWS Config managed conformance pack provides a curated mapping between the AWS Well-Architected Framework Performance Efficiency pillar best practices and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more AWS Well-Architected Framework best practices. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** AWS-WAF_V10_PERFORMANCE-EFFICIENCY

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 6 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-branch-performance-mode-enabled | PERF04-BP05, PERF05-BP02, PERF06-BP02, PERF08-BP01, PERF08-BP05 | Enabling performance mode on AWS Amplify branches optimizes application delivery by implementing advanced caching strategies, content compression, and edge optimization techniques. Performance mode reduces page load times, improves user experience, and can decrease bandwidth costs by serving optimized | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | content from edge locations. Organizations should enable this feature to ensure their web applications meet performance standards and provide optimal user experiences across different geographic locations. | Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| autoscaling-capacity-rebalancing | PERF05-BP04 | Capacity Rebalancing ensures the availability of Auto Scaling groups by proactively launching additional EC2 Spot Instances when existing instances are at an elevated risk of interruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| clb-multiple-az | PERF05-BP04 | Deploying AWS ELB's across multiple Availability Zones ensures availability of critical functions in the event of an AZ outage, or during regular maintenance, and allows organizat ions to maintain business operations. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cloudwatch-alarm-a ction-check | PERF07-BP04 | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confident iality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | PERF07-BP01 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-enhanced-monitoring-enabled | PERF07-BP01, PERF07-BP04 | Enhanced monitoring is crucial for maintaining operational visibility and performance of Kafka clusters. Without detailed monitoring, organizations may miss critical performance issues or capacity problems. Implementing enhanced monitoring supports better cluster management and troubleshooting. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

## AWS Well-Architected Framework (WAF) v10 - Reliability Pillar

This AWS Config managed conformance pack provides a curated mapping between the AWS Well-Architected Framework Reliability pillar best practices and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more AWS Well-Architected Framework best practices. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** AWS-WAF_V10_RELIABILITY

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 60 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | REL06-BP07 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into applicati on performance, request flows, and potential bottlenec ks across distribut ed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliabili | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | ty and optimizin g user experienc e. This monitorin g capability also supports complianc e requirements for application observabi lity and helps detect anomalous behavior patterns that could indicate security issues. | |
| aurora-last-backup -recovery-point-cr eated | REL13-BP01 | Maintaining backup recovery points enables efficient data restoration and business continuity for Aurora databases in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-resources-protected-by-backup-plan | REL09-BP01, REL09-BP03 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-capacity-rebalancing | REL06-BP04, REL07-BP02, REL11-BP03, REL13-BP05 | Capacity Rebalancing ensures the availability of Auto Scaling groups by proactively launching additional EC2 Spot Instances when existing instances are at an elevated risk of interruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-group-elb-healthcheck-required | REL06-BP04, REL07-BP01, REL07-BP02, REL07-BP03, REL10-BP01, REL11-BP01, REL11-BP02, REL11-BP03 | Activating ELB health checks for Auto Scaling groups enables the detection of application-level issues that basic EC2 status checks cannot identify. When an instance fails ELB health checks, Auto Scaling can automatically replace it, maintaining application availability and reducing downtime. Without these enhanced health checks, unhealthy instances might continue serving traffic despite application failures, leading to degraded user experience and potential service disruptions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-multiple-az | REL06-BP04, REL07-BP02, REL11-BP03 | Amazon EC2 Auto Scaling group that spans multiple Availability Zones reduces the chances of total outage of instances should an availability zone become unavailable. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| backup-plan-min-frequency-and-min-retention-check | REL09-BP01, REL09-BP03 | Data loss can occur if recovery points expire before a defined retention period. By configuring the frequency of backup and retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-encrypted | REL09-BP02 | Encrypt AWS Backup recovery point to protect the backup information. Encrypting the backup recovery point ensures the confidentiality and integrity of the stored backup information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| backup-recovery-point-manual-deletion-disabled | REL09-BP02 | A backup vault policy prevents the deletion of backup recovery points and allows you to grant access to users to create and update backup plans and on-demand backups for the resources contained in backup vaults. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-minimum-retention-check | REL09-BP01 | Data loss can occur if recovery points expire before a defined retention period. By configuring the retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-enabled | REL11-BP07 | Enabled Batch compute environments are essential for maintaining operational continuity and ensuring that batch processing workloads can execute as expected. Disabled compute environments prevent job queues from launching instances and processing jobs, which can lead to application failures, delayed data processing, and potential business impact. Monitoring the enabled state helps detect unintended configuration changes that could disrupt critical batch processing operations and ensures that compute resources remain available for scheduled and on-demand workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | REL11-BP07 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| | | vulnerabilities or operational issues. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| beanstalk-enhanced-health-reporting-enabled | REL11-BP01, REL11-BP02 | Enabling health checks in Elastic Beanstalk is crucial for maintaining the reliability and availability of your application. Health checks help ensure that your applicati on's instances are functioning correctly and can automatic ally replace or recover unhealthy instances , improving overall system resilience. By regularly monitorin g the health of your application, you can proactively identify and address issues, minimizin g downtime and providing a smoother user experience. This feature is especiall y important in dynamically scaling environments, where instances can be added or removed based on demand, as it helps maintain a consistent and | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | responsive applicati on environment. | |
| clb-multiple-az | REL13-BP05 | Deploying AWS ELB's across multiple Availability Zones ensures availability of critical functions in the event of an AZ outage, or during regular maintenance, and allows organizat ions to maintain business operations. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cloudformation-sta ck-notification-check | REL06-BP03 | Sending event notifications to an SNS topic allows you to perform real time monitoring of your CloudForm ation stacks and proactively manage the provisioning and update process of AWS resources . CloudFormation stacks event notificat ions help identify unauthorized actions and ensure that AWS resources meet corporate standards and compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Spain), Israel (Tel Aviv), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | REL11-BP06 | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-auto-rollback-enabled | REL11-BP07 | Auto rollback configuration in CodeDeploy deployment groups provides critical protection against failed deployments by automatically reverting to the previous working version when deployment failures or alarm thresholds are triggered. This capability minimizes application downtime, reduces the impact of problematic deployments, and ensures service availability. Without auto rollback enabled, failed deployments may require manual intervention to restore service, potentially leading to extended outages and degraded user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-protected-by-backup-plan | REL09-BP03 | Ensuring EC2 instances are included in a backup plan allows for recovery of instance data and applications in the event of loss or corruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

## AWS Well-Architected Framework (WAF) v10 - Security Pillar

This AWS Config managed conformance pack provides a curated mapping between the AWS Well-Architected Framework Security pillar best practices and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more AWS Well-Architected Framework best practices. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** AWS-WAF_V10_SECURITY

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 186 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-internal-scheme-check | SEC05-BP01, SEC05-BP02 | Internal scheme configuration for Application Load Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | This configuration helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requirements that mandate network segmentation and controlled access to application infrastructure. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | SEC08-BP02 | When caching is enabled, Amazon API Gateway service caches responses from API endpoint, reduces the number of calls made to an API endpoint and improves the latency of requests to the API. In addition, encrypted REST API caches protect data from unauthorized access. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | SEC04-BP01, SEC04-BP02 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-replicate-to-ssm | SEC01-BP06 | Replicating AppConfig deployment strategies to Systems Manager documents provides centralized configuration management, enhanced auditability, and improved operational visibility. This practice enables teams to maintain consistent deployment patterns across environments, facilitates compliance reporting by creating auditable records of deployment configurations, and supports disaster recovery scenarios by ensuring deployment strategies are preserved in a managed service with built-in versioning and access controls. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | SEC05-BP01, SEC05-BP04 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | SEC09-BP02 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | SEC04-BP01 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | SEC09-BP02, SEC09-BP04 | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | SEC04-BP01 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | SEC05-BP01, SEC05-BP02 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | SEC05-BP01, SEC05-BP02 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appstream-fleet-in-vpc | SEC05-BP01, SEC05-BP02 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configuration supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | SEC08-BP02 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | SEC09-BP02 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | SEC08-BP02 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | SEC04-BP01, SEC04-BP02 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | SEC08-BP01, SEC08-BP02 | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | SEC03-BP02 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | SEC04-BP01, SEC04-BP02 | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-mysql-cluster-audit-logging | SEC04-BP01 | Audit logging is essential for maintaining database security and regulatory compliance by providing detailed records of all database activities, including user connections, queries, and administrative actions. This capability enables security teams to detect unauthorized access attempts, investigate potential security incidents, and meet compliance requirements for data governance. Without audit logging, organizations lack visibility into database operations and cannot effectively monitor for suspicious activities or demonstrate compliance with regulatory frameworks that require | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | comprehensive audit trails. | |
| aurora-resources-in-logically-air-gapped-vault | SEC01-BP01 | Logical air-gapping is essential for protecting critical database systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical database resources. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| backup-recovery-point-encrypted | SEC08-BP02 | Encrypting data at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-custom-ssl-certificate | SEC09-BP04 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | SEC08-BP04 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | SEC04-BP01, SEC04-BP02 | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-write-s3-data-event-check | SEC04-BP01, SEC04-BP02 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for write data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | if you configure a multi-Region trail that logs write-only or all types of data events for all S3 buckets. | |
| cloudtrail-s3-bucket-access-logging | SEC04-BP01 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | SEC04-BP01, SEC04-BP02 | CloudTrail provides critical visibility into account activity by recording AWS API calls and related events. Without CloudTrail enabled, organizations lose the ability to conduct security analysis, resource change tracking, and compliance auditing. This detective control identifies accounts lacking proper logging capabilit ies, which creates security blind spots that prevent effective incident investiga tion, complianc e verification, and detection of unauthorized activitie s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | SEC08-BP02, SEC08-BP03 | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cmk-backing-key-rotation-enabled | SEC08-BP01, SEC09-BP01 | Rotating KMS keys to reduce the risk of the key being compromised and prevent hackers from gaining access to your data and resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| codebuild-project-artifact-encryption | SEC08-BP02 | Ensure all artifacts within a CodeBuild project have encryption enabled for data at rest provides an extra layer of protectio n in the event of a security incident or unathorized access. This control operates by analyzing whether all of the artifacts inside of a CodeBuild project have encryption enabled. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-s3-logs-encrypted | SEC08-BP02 | Enforcing encryption on S3 logs generated by AWS CodeBuild projects protects the confidentiality and integrity of data. This control analyzies the settings and policies of the CodeBuild project and S3 bucket to ensure that encryption is enforced for logging. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| codebuild-report-group-encrypted-at-rest | SEC08-BP02 | Encrypting CodeBuild report groups is crucial for protecting sensitive build and test information. Unencrypted report data could be exposed if storage systems are compromised. Implementing encryption adds an essential layer of security for build and test results. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | SEC03-BP01 | Preventing unauthenticated access to Cognito Identity Pools is critical for maintaining security boundaries and implementing proper access controls. Allowing unauthenticated identities can expose AWS resources to unauthorized users, potentially leading to data breaches, resource abuse, or compliance violations. By monitoring and detecting Identity Pools with unauthenticated access enabled, organizations can ensure that all users are properly authenticated before receiving temporary AWS credentials, supporting defense-in-depth security strategies and regulatory compliance requirements. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-advanced-security-enabled | SEC02-BP01, SEC08-BP04 | Advanced security features in Cognito user pools are essential for protecting against unauthorized access and potential threats. Without these features, user accounts may be more vulnerable to attacks such as credential stuffing or brute force attempts. Enabling advanced security strengthens overall user authentication and access control. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | SEC04-BP01 | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| custom-eventbus-policy-attached | SEC03-BP01 | Attaching a resource policy helps control access to custom EventBus resources , enforcing least privilege and reducing the risk of unauthorized access. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | SEC09-BP02 | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |
| datasync-task-logging-enabled | SEC04-BP01, SEC04-BP02 | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | SEC09-BP02, SEC09-BP04 | HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. You should only allow encrypted connections over TLS to access DAX clusters. However, encrypting data in transit can affect performance. You should test your application with encryption turned on to understand the performance profile and the impact of TLS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-mongo-db-authentication-enabled | SEC08-BP04 | Enabling authentication for MongoDB endpoints is critical for maintaining data security during migrations. Without proper authentication, unauthorized access to sensitive data could occur. Implementing password-based authentication helps protect MongoDB data stores from unauthorized access and potential data breaches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-neptune-iam-authorization-enabled | SEC03-BP01 | IAM authentication for Neptune endpoints provides robust, scalable access control. Without IAM authentication, managing access to Neptune databases during migrations could be less secure and more complex. Implementing IAM authorization ensures fine-grained control over who can access Neptune data through DMS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-redis-tls-enabled | SEC09-BP02, SEC09-BP04 | TLS provides end-to-end security when data is sent between applications or databases over the internet. When you configure SSL encryption for your DMS endpoint, it enables encrypted communication between the source and target databases during the migration process. This helps prevent eavesdropping and interception of sensitive data by malicious actors. Without SSL encryption, sensitive data may be accessed, resulting in data breaches, data loss, or other security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-sourcedb-logging | SEC04-BP01 | Proper logging of DMS replication tasks is crucial for maintaining operational visibility and ensuring data integrity. Without adequate logging, issues in the replication process might go undetected, potentially leading to data inconsistencies. Configuring appropriate logging supports efficient troubleshooting and monitoring of migration processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted | SEC08-BP02 | Encrypting data at rest protects the confidentiality and integrity of data and reduces the risk of unauthorized access to data. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | SEC09-BP02, SEC09-BP04 | You can use TLS to encrypt the connection between an application and an Amazon DocumentDB cluster. Use of TLS can help protect data from being intercepted while the data is in transit between an application and an Amazon DocumentDB cluster. Encryption in transit for an Amazon DocumentDB cluster is managed using the TLS parameter in the cluster parameter group thats associated with the cluster. When encryption in transit is enabled, secure connections using TLS are required to connect to the cluster. We recommend using the following TLS parameters: tls1.2, tls1.3, and fips-140-3. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-table-encrypted-kms | SEC08-BP02 | Encryption of data at rest in DynamoDB is enabled by default. Using AWS KMS reduces the operational complexity of managing encryption keys by integrating transparently with DynamoDB. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ebs-resources-in-logically-air-gapped-vault | SEC01-BP01 | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-snapshot-public-restorable-check | SEC05-BP01, SEC05-BP02 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| ec2-ebs-encryption-by-default | SEC08-BP02, SEC08-BP03 | Sensitive data can exist at rest on EBS volumes. All sensitive data should be protected at rest using strong cryptography, to protect the confident iality and integrity of information and prevent and protect data in storage. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | SEC05-BP01, SEC05-BP02 | Source/destination check is a critical security feature that ensures network interfaces can only send receive traffic that is specifically destined for or originates from the interface. Disabling this check without proper justification can create security vulnerabilities by allowing traffic forwarding potential network bypasses. Monitoring this setting helps maintain network security boundaries, prevents unauthorized traffic routing, ensures compliance with network security policies. This control is particularly important for maintaining the integrity of network traffic flows preventing potential security misconfigurations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | SEC01-BP06 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | SEC06-BP02 | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | SEC06-BP01 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-in-logically-air-gapped-vault | SEC01-BP01 | Logical air-gapping is essential for protecting critical compute resources from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive systems. Implementing air-gapping provides an additional security barrier for critical EC2 instances. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | SEC08-BP02, SEC08-BP03 | For an additional layer of security, you should enable encryption for Amazon EBS volumes. Encryption operations then occur on the servers that host Amazon EC2 instances, which helps ensure the security of both data at rest and data in transit between an instance and its attached EBS storage. Amazon EBS encryption is a straightforward encryption solution for EBS resources associated with your EC2 instances. With EBS encryption, you arent required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-logging-enabled | SEC04-BP01 | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | SEC06-BP01 | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabilities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | SEC05-BP01, SEC05-BP02 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentation, reduces the attack surface, ensures containers operate within isolated network environments as intended by containerization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| efs-encrypted-check | SEC08-BP02 | Encrypting data at rest on EFS protects data from unauthorized access, reduces the risk of potential data breaches, and meets compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-filesystem-ct-encrypted | SEC08-BP02 | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryption, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-resources-in-logically-air-gapped-vault | SEC05-BP01 | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| eks-cluster-log-enabled | SEC04-BP01 | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | SEC08-BP01, SEC08-BP02 | When you encrypt secrets, you can use AWS Key Management Service (AWS KMS) keys to provide envelope encryption of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryption for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applications by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-rbac-auth-enabled | SEC03-BP05 | RBAC authentication provides fine-grained access control for Redis clusters. Without RBAC, managing access to cache resources could be less secure and more difficult to maintain. Implementing RBAC ensures proper authentication and authorization for cache access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-at-rest | SEC08-BP02 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-in-transit | SEC09-BP04 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic, and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-encrypted-at-rest | SEC08-BP02 | Configuring encryption at rest for OpenSearch is crucial to ensure the security and confidentiality of your data. By encrypting data at rest, you protect it from unauthorized access and potential breaches, mitigating the risk of data exposure. This essential security measure helps maintain compliance with industry standards and regulations, building trust with users and safeguarding your organization's reputation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elastic-beanstalk-managed-updates-enabled | SEC06-BP01 | Automatically applying managed patches in Elastic Beanstalk ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | SEC09-BP02 | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | SEC05-BP01, SEC05-BP02 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-master-no-public-ip | SEC05-BP02, SEC06-BP02 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-security-configuration-encryption-rest | SEC08-BP02 | Encryption at rest for Amazon EMR clusters protects sensitive data stored on cluster instances from unauthorized access. This control helps ensure compliance with data protection regulations and security best practices by detecting EMR configurations that lack proper encryption settings. Monitoring encryption configuration helps prevent data exposure risks and maintains data confidentiality for big data processing workloads. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | SEC09-BP02 | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). | fsx-windows-audit-log-configured | SEC04-BP01 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | SEC04-BP01, SEC04-BP02 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | SEC08-BP02, SEC08-BP03 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-ec2-protection-runtime-enabled | SEC04-BP02 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-ecs-protection-runtime-enabled | SEC04-BP02 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon ECS clusters on AWS Fargate. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-eks-protection-audit-enabled | SEC04-BP01, SEC04-BP02 | EKS Audit Log Monitoring is crucial for maintaining security visibility in Kubernetes environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilities for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | SEC04-BP01, SEC04-BP04, SEC05-BP03, SEC09-BP03 | EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | SEC03-BP02 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | SEC01-BP02 | Root user should not routinely access the AWS account. The access key for your AWS account root user gives full access to all your resources for all AWS services, including your billing informati on. You can't reduce the permissions associated with your AWS account root user access key. This helps to minimize potential unwanted or even unauthori zed changes to the environment, which could result in a negative impact to the business. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | SEC09-BP01 | Expired SSL/TLS server certificates left in IAM can be inadvertently associated with resources, causing failed or insecure connections and weakening trust in the certificate chain. Promptly removing expired certificates reduces the risk of outages and of clients negotiating connections with invalid credentials, and keeps the certificate inventory accurate. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-mfa-enabled | SEC02-BP01 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | SEC03-BP02 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | SEC06-BP01 | EC2 security scanning is crucial for maintaining strong security posture of compute resources . Without regular scanning, organizat ions may be unaware of vulnerabilities in their EC2 instances . Implementing automated scanning helps identify and address security weaknesses. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Canada West (Calgary) , Europe (Spain), Mexico (Central) , and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-ecr-scan-enabled | SEC06-BP01 | Container image scanning is essential for maintaining security in container ized environments. Without regular scanning, organizat ions may deploy containers with known vulnerabi lities. Implement ing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Canada West (Calgary) , Europe (Spain), Mexico (Central) , and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-code-scan-enabled | SEC06-BP01 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| inspector-lambda-standard-scan-enabled | SEC11-BP02 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | SEC02-BP01 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | SEC03-BP02 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | SEC08-BP02 | Server-side encryption is a feature in Amazon Data Firehose delivery streams that automatically encrypts data before its at rest by using a key created in AWS Key Management Service (AWS KMS). Data is encrypted before its written to the Data Firehose stream storage layer, and decrypted after its retrieved from storage. This allows you to comply with regulatory requirements and enhance the security of your data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-stream-encrypted | SEC08-BP02 | Ensuring encryption is enabled for Kinesis data streams at rest reduces the likelihood of unintentional data exposure and reduces the risk of a data breach. Server side encryption is available in Kineses to perform this function. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-cmk-not-scheduled-for-deletion | SEC08-BP01, SEC09-BP01 | KMS keys cannot be recovered if deleted and any data which has been encrypted by that KMS key will be unrecoverable leading to business loss of data. If meaningful data has been encrypted under a KMS key scheduled for deletion, consider decrypting the data or re-encrypting the data under a new KMS key unless you are intentionally performing a cryptographic erasure. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | SEC03-BP01 | A publicly accessible AWS KMS key policy allows principal s outside your organization to use the key for cryptographic operations, which can lead to unauthori zed decryption of protected data or unsanctioned encryption. Restricti ng the key policy to specific trusted principals enforces least privilege and protects the confidentiality of data encrypted with the key. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| macie-auto-sensitive-data-discovery-check | SEC07-BP03 | Amazon Macie uses machine learning to detect sensitive data like personally identifiable informati on (PII). Enabling Amazon Macie monitors for and prevents unauthori zed exposure of sensitive data, reducing compliance risks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | SEC02-BP01 | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | SEC02-BP04 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | SEC04-BP01 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-log-enabled | SEC04-BP01 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | SEC03-BP02, SEC05-BP02, SEC08-BP04 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | SEC05-BP01, SEC05-BP02 | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-connect-connector-logging-enabled | SEC04-BP01 | Enabling logging for MSK Connect connectors is essential for operational visibility, troubleshooting, and security monitorin g. Logs provide critical insights into connector performance, data processing activitie s, error condition s, and potential security events. Without proper logging, organizat ions lose the ability to effective ly monitor data pipeline operation s, diagnose issues, meet compliance requirements for audit trails, and detect suspicious activities or data processing anomalies. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | SEC02-BP01, SEC03-BP01, SEC03-BP02 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | SEC04-BP01 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | SEC08-BP02 | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-encrypted | SEC08-BP02 | Enabling encryption at rest for Amazon Neptune DB cluster snapshots protects the data against unauthorized access to sensitive data, and helps achieve compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | SEC03-BP05, SEC05-BP02, SEC05-BP04 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewalls subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | SEC05-BP01, SEC05-BP02 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | SEC04-BP01 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-encrypted-at-rest | SEC08-BP02 | Configuring encryption at rest for OpenSearch is crucial to ensure the security and confidentiality of your data. By encrypting data at rest, you protect it from unauthorized access and potential breaches, mitigating the risk of data exposure. This essential security measure helps maintain compliance with industry standards and regulations, building trust with users and safeguarding your organization's reputation. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-update-check | SEC06-BP01 | Configuring the latest updates for Amazon OpenSearch service domains helps to improve security, optimize performance, maintain compatibility with other systems, and address known bugs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | SEC04-BP01 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | SEC08-BP02 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | SEC09-BP02 | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | SEC09-BP02 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgresql-logs-to-cloudwatch | SEC04-BP01, SEC04-BP02 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgres-instance-encrypted-in-transit | SEC09-BP02 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | SEC09-BP02 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-snapshot-encrypted | SEC08-BP02 | Enabling encryption at rest for RDS cluster snapshots and RDS database protects your data against unauthorized access to sensitive data and helps achieve compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | SEC09-BP02 | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | SEC04-BP01, SEC04-BP02 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | SEC08-BP02 | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| redshift-require-tls-ssl | SEC09-BP04 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | SEC04-BP01 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | SEC09-BP02 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | SEC05-BP01, SEC05-BP02 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | SEC05-BP01, SEC05-BP02 | Routing Redshift Serverless workgroup traffic through a VPC provides essential network isolation and security controls. VPC routing enables organizations to implement network-level access controls, monitor traffic patterns, and maintain compliance with security frameworks that require private network configurations. This control helps prevent unauthorized external access to data warehouse resources and ensures that sensitive data processing occurs within a controlled network environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-unrestricted-port-access | SEC05-BP02, SEC08-BP04 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implementing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | SEC02-BP01 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentials making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | SEC02-BP01 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| s3-access-point-in-vpc-only | SEC05-BP02, SEC08-BP04 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-public-access-blocks | SEC08-BP04 | Enabling block public access for Amazon S3 access points enhances security by preventing unauthorized access from the public internet, mitigating the risk of data breaches, and ensuring compliance with security best practices and regulatory requirements. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks | SEC05-BP02, SEC08-BP04 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | SEC05-BP02, SEC08-BP04 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-default-lock-enabled | SEC08-BP04 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | SEC05-BP02, SEC08-BP04 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-logging-enabled | SEC04-BP01 | Enabling S3 bucket logging on target S3 buckets allows you to capture all events that might affect objects in a target bucket. Configuring logs to be placed in a separate bucket enables access to log information, which can be useful in security and incident response workflows and provides redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-public-read-prohibited | SEC03-BP02, SEC05-BP02, SEC08-BP04 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | SEC03-BP02, SEC05-BP02, SEC08-BP04 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | SEC08-BP02 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-ssl-requests-only | SEC09-BP04 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-versioning-enabled | SEC08-BP04 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and application failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanently, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encryption-kms | SEC08-BP02, SEC08-BP03 | Protecting objects in S3 using encryption at rest with KMS prevents unauthorized access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | SEC05-BP01, SEC05-BP02 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-configuration-kms-key-configured | SEC08-BP02 | Enabling encryption with AWS KMS protects data at rest in Amazon SageMaker, making it difficult for unauthorized individuals to access or manipulate the data. AWS KMS provides centralized key management, facilitating the management of keys and their lifecycle. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | SEC05-BP01, SEC05-BP02 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | SEC05-BP01, SEC05-BP02 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-kms-key-configured | SEC08-BP02 | Sensitive information can be stored on the storage volumes attached to Amazon SageMaker notebook instance. Amazon KMS key ensures that the data at rest is encrypted. Encryption of data-at-rest is a recommended best practice to add a layer of access management around your data. In case of any compromise to your SageMaker resources, encryption-at-rest ensures that you data is protected from unintended access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| secretsmanager-rotation-enabled-check | SEC02-BP03 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| secretsmanager-scheduled-rotation-success-check | SEC02-BP03 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-secret-periodic-rotation | SEC02-BP03 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | SEC04-BP03, SEC04-BP04 | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| shield-drt-access | SEC10-BP05 | The Shield Response Team (SRT) provides added support with security engineers who specialize in DDoS event response. As an additional layer of support to your AWS Support plan, you can work directly with the SRT, leveraging their expertise as part of your event response workflow. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| sns-encrypted-kms | SEC08-BP02 | Encrypting data at rest reduces the risk of data stored on disk being accessed by unauthenticated users. This adds a data protection layer from a threat actor attempting to gain unauthorized access to SNS topic data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | SEC05-BP02, SEC08-BP04 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | SEC03-BP02, SEC08-BP04 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | based application architectures. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | SEC03-BP02, SEC08-BP04 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | SEC03-BP01, SEC03-BP02, SEC08-BP04 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | SEC04-BP01 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-document-not-public | SEC06-BP02 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| transfer-connector-logging-enabled | SEC04-BP01, SEC04-BP02 | Enabling CloudWatch logging for an AWS Transfer Family connector records file-transfer activity and errors that are essential for monitoring, troubleshooting, and investigating unauthorized or anomalous transfers. Without these logs, malicious activity can go undetected and forensic analysis is limited. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | SEC09-BP02 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | SEC05-BP01, SEC05-BP02, SEC05-BP04 | Security groups provide stateful filtering of ingress and egress network traffic to AWS resources. We recommend that no security group allow unrestricted ingress access to remote server administration ports, such as SSH to port 22 and RDP to port 3389, using either the TDP (6), UDP (17), or ALL (-1) protocols. Permitting public access to these ports increases resource attack surface and the risk of resource compromise. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-not-empty | SEC05-BP04 | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| wafv2-webacl-not-empty | SEC05-BP04 | Web access control lists (ACLs) without any configured rules or rule groups will not perform traffic inspection or filtering, allowing all web traffic to pass through unchecked. Configuring rules or rule groups enables enforcement of web application security policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| waf-global-rulegroup-not-empty | SEC05-BP04 | AWS Web Application Firewall (WAF) Classic global rule groups, without any configured rules, will not inspect or filter web traffic, potentially allowing malicious or unauthorized traffic to pass through. Configuring rules enables traffic inspection and enforcement of security policies. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-rule-not-empty | SEC05-BP04 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-webacl-not-empty | SEC05-BP04 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-regional-rulegroup-not-empty | SEC05-BP04 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-regional-rule-not-empty | SEC05-BP04 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-regional-webacl-not-empty | SEC05-BP04 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| workspaces-root-volume-encryption-enabled | SEC08-BP02, SEC08-BP03 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | SEC08-BP02, SEC08-BP03 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

## AWS Well-Architected Framework (WAF) v10 - Sustainability Pillar

This AWS Config managed conformance pack provides a curated mapping between the AWS Well-Architected Framework Sustainability pillar best practices and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more AWS Well-Architected Framework best practices. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** AWS-WAF_V10_SUSTAINABILITY

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 8 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | SUS02-BP03 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-branch-performance-mode-enabled | SUS03-BP03 | Enabling performance mode on AWS Amplify branches optimizes application delivery by implementing advanced caching strategies, content compression, and edge optimization techniques. Performance mode reduces page load times, improves user experience, and can decrease bandwidth costs by serving optimized content from edge locations. Organizations should enable this feature to ensure their web applications meet performance standards and provide optimal user experiences across different geographic locations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-capacity-rebalancing | SUS02-BP01 | Capacity Rebalancing ensures the availability of Auto Scaling groups by proactively launching additional EC2 Spot Instances when existing instances are at an elevated risk of interruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-group-elb-healthcheck-required | SUS02-BP01 | Activating ELB health checks for Auto Scaling groups enables the detection of application-level issues that basic EC2 status checks cannot identify. When an instance fails ELB health checks, Auto Scaling can automatically replace it, maintaining application availability and reducing downtime. Without these enhanced health checks, unhealthy instances might continue serving traffic despite application failures, leading to degraded user experience and potential service disruptions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-multiple-az | SUS02-BP01 | Amazon EC2 Auto Scaling group that spans multiple Availability Zones reduces the chances of total outage of instances should an availability zone become unavailable. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| ecr-private-lifecycle-policy-configured | SUS04-BP03 | Amazon ECR lifecycle policies provide more control over the lifecycle managemen t of images in a private repositor y to automate the cleaning up of your container images by expiring images based on age or count and maintain a strong security posture. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-lifecycle-policy-check | SUS04-BP03 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-version-lifecycle-policy-check | SUS04-BP03 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

## CIS Critical Security Controls v8 - Implementation Group 1 (IG1)

This AWS Config managed conformance pack provides a curated mapping between the Center for Internet Security (CIS) Critical Security Controls Version 8 Implementation Group 1 (IG1) safeguards and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more CIS safeguards. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** CIS_V8_IG1

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 159 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-listener-tagged | 1.1 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | practices improve operational visibilit y and enable automated resource lifecycle managemen t through tag-based policies. | available in the AWS GovCloud (US) Regions. |
| alb-tagged | 1.1 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting . Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining operational visibilit y across environme nts. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | 6.2, 6.3, 8.2 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | 1.1 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | 1.1 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | 1.1, 2.1 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | 1.1, 2.1 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | 4.1 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | 1.1, 2.1 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | 1.1, 2.1 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | 1.1 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | 1.1, 2.1 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | 1.1, 2.1 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | 1.1, 2.1 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | 8.2 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | 1.1, 2.1 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | 8.2 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | 1.1, 2.1 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | 1.1, 2.1 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | 1.1, 2.1 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | 8.2 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appsync-cache-ct-encryption-at-rest | 14.8 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-in-transit | 14.4 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | 14.8 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | 8.2 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | 6.2, 6.3, 8.2 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | 4.1 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | 6.2, 6.3, 6.5, 8.2 | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-mysql-cluster-audit-logging | 8.2 | Audit logging is essential for maintaining database security and regulatory compliance by providing detailed records of all database activities, including user connections, queries, and administrative actions. This capability enables security teams to detect unauthorized access attempts, investigate potential security incidents, and meet compliance requirements for data governance. Without audit logging, organizations lack visibility into database operations and cannot effectively monitor for suspicious activities or demonstrate compliance with regulatory frameworks that require | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | comprehensive audit trails. | |
| aurora-resources-in-logically-air-gapped-vault | 14.1 | Logical air-gapping is essential for protecting critical database systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical database resources. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| backup-plan-min-frequency-and-min-retention-check | 11.2 | Data loss can occur if recovery points expire before a defined retention period. By configuring the frequency of backup and retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | 4.1 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | vulnerabilities or operational issues. | |
| cloudtrail-all-read-s3-data-event-check | 6.2, 6.3, 6.5, 8.2 | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-write-s3-data-event-check | 8.2 | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-s3-bucket-access-logging | 8.2 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthori zed access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investiga tions. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-bucket-public-access-prohibited | 3.3 | Protecting CloudTrail logs from public access is essential for maintaining the security of audit data. Public exposure of audit logs could reveal sensitive information about your infrastructure and operations. Implementing strict access controls prevents unauthorized access to critical security information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-data events-enabled | 8.2 | Logging data events on S3 buckets is an important piece of maintaining the reliability, availabil ity, and performan ce of Amazon S3 and your AWS solutions. Collecting monitoring data for object-level requests supports your Incident Response plan by allowing you to identify potential issues and respond on a timely manner; or to provide valuable data for forensics, auditing, and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-metric-stream-tagged | 1.1 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources , tracking ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | 8.2 | Enabling CloudTrail provides essential visibility into your AWS environment by recording API activity and changes, aiding in security monitoring, compliance audits, and troubleshooting incidents. It enhances accountability, enables rapid incident response, and facilitates thorough forensic analysis of events within your cloud infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | 1.1 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | 7.1 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | 1.1 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | 8.2 | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cw-loggroup-retention-period-check | 8.1 | Configuring retention periods for Amazon CloudWatch log groups ensures that data is kept for the required duration, to meet organizational compliance requirements, and allows the review and investigation of suspicious activities. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| datasync-task-logging-enabled | 8.2 | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| ec2-enis-source-destination-check-enabled | 4.4 | Source/destination checking for Amazon EC2 instances and attached ENIs should be enabled and configured consistently across your EC2 instances. Each ENI has its own setting for source/destination checks. If source/destination checking is enabled, Amazon EC2 enforces source/destination address validation, which ensures that an instance is either the source or the destination of any traffic that it receives. This provides an additional layer of network security by preventing resources from handling unintended traffic and preventing IP address spoofing. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | 1.1 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | 4.1 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | 4.3, 4.6 | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | 7.3 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | 1.1 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-tagged | 1.1 | Proper tagging of Network Insights access scopes enables effective resource management, cost allocation, governance across AWS environments. Tags provide essential metadata for tracking resource ownership, purpose, lifecycle management. Consistent tagging practices support automated operations, security policies, compliance reporting requirements. Without adequate tagging, organizations lose visibility into resource utilization patterns struggle to implement effective cost controls access management policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-path-tagged | 1.1 | Proper tagging of Network Insights paths enables effective resource management, cost allocation, operational governance. Tags facilitate automated resource discovery, support compliance reporting requirements, enable consistent application of organizational policies across network analysis resources. Without standardized tagging, organizations lose visibility into resource ownership, purpose, associated costs, making it difficult to maintain operational control meet regulatory requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | 3.6 | For an additional layer of security, you should enable encryption for Amazon EBS volumes. Encryption operations then occur on the servers that host Amazon EC2 instances, which helps ensure the security of both data at rest and data in transit between an instance and its attached EBS storage. Amazon EBS encryption is a straightforward encryption solution for EBS resources associated with your EC2 instances. With EBS encryption, you arent required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | 1.1 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | 8.2 | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | 1.1 | Proper tagging of VPN connections enables effective resource management, cost allocation, governance oversight. Tags facilitate automated operations, security policies, compliance reporting by providing metadata that identifies resource ownership, purpose, environment, other critical attributes. Consistent tagging practices improve operational visibility support organizational policies for resource lifecycle management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | 1.1 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | 1.1 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | 11.2 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | 1.1 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | 3.3 | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | 1.1 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operation al visibility. Tags enable organizat ions to categoriz e track add-ons by environment, owner, project, or cost center, facilitat ing accurate billing resource governanc e. Consistent tagging practices support automated management workflows, security policies, complianc e reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernete s infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | 8.2 | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | 11.2 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | 1.1 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-tagged | 2.1 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentat ion. Proper tagging enables efficient resource managemen t, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | 8.2 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | 1.1 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | 11.2 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | 1.1 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | 8.2 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | 1.1 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | 1.1 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | 8.2 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-audit-enabled | 8.2 | GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious or malicious activity in your Amazon EKS clusters, such as unauthorized API calls, privilege escalation, and configuration tampering. Enabling it provides continuous threat detection for the container control plane so that compromises can be identified and investigated quickly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | 8.2 | EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| guardduty-malware-protection-enabled | 10.1, 10.2, 8.2 | Malware Protection is essential for maintaining a strong security posture against malicious software. Without this feature, organizations may be vulnerable to undetected malware threats. Implementing Malware Protection enhances threat detection capabilities across AWS resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | 1.1 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | 5.2 | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | 4.7 | Root user should not routinely access the AWS account. The access key for your AWS account root user gives full access to all your resources for all AWS services, including your billing informati on. You can't reduce the permissions associated with your AWS account root user access key. This helps to minimize potential unwanted or even unauthori zed changes to the environment, which could result in a negative impact to the business. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | 1.1 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | 1.1 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-mfa-enabled | 6.5 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | iotdevicedefender-custom-metric-tagged | 1.1 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | 2.1 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | 2.1 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-gateway-tagged | 2.1 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | 2.1 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | 2.1 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industrial IoT initiatives. Without proper tagging, organizations may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). | --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | 1.1 | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | 1.1 | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-stream-backup-retention-check | 3.4 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-key-policy-no-public-access | 5.4 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | 1.1 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | 8.2 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | 1.1 | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-certificate-tagged | 1.1 | Tagging Lightsail certificates enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking certificate ownership, purpose, and lifecycle management. Consistent tagging practices improve operational visibility, facilitate automated management tasks, and support compliance requirements by ensuring all SSL/TLS certificates can be properly identified and categorized within the infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-disk-tagged | 1.1 | Proper tagging of Lightsail disks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for asset identification. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, and face challenges in implementing automated management workflows. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | 6.5 | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-automatic-minor-version-upgrade-enabled | 7.4 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-auto-minor-version-upgrade-enabled | 7.4 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | 8.2 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| mq-cloudwatch-audit-log-enabled | 8.2 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | 3.3 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | 8.2 | Enabling logging for MSK Connect connectors is essential for operational visibility, troubleshooting, and security monitoring. Logs provide critical insights into connector performance, data processing activities, error conditions, and potential security events. Without proper logging, organizations lose the ability to effectively monitor data pipeline operations, diagnose issues, meet compliance requirements for audit trails, and detect suspicious activities or data processing anomalies. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | 6.3, 6.4, 6.5 | Disabling unauthenticated access to Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. Unauthenticated access can lead to data breaches, unauthorized data consumption or production, and potential compliance violations. Implementing proper authentication mechanisms ensures that only authorized users and applications can interact with Kafka topics and helps maintain audit trails for access monitoring and compliance reporting. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| multi-region-cloudtrail-enabled | 8.2 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilities, and proactive security monitoring. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | 4.1, 4.2 | Enabling subnet change protection on Network Firewall instances prevents unauthorized modifications to firewall subnet associations, which could compromise network security boundaries and traffic inspection capabilities. This protection helps maintain the integrity of network segmentation policies and ensures that firewall rules continue to be applied to the intended network traffic flows. Without this protection, malicious actors or accidental configuration changes could bypass security controls by modifying subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | 8.2 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | 1.1 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | 8.2 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| rds-cluster-default-admin-check | 4.7 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | 1.1 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-default-admin-check | 4.7 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-logging-enabled | 8.2 | Enabling logging for RDS helps monitor the environment to detect potential suspicious activity and unauthorized access to data. Amazon RDS logs are sent to CloudWatch for redundancy. RDS logging provides a mechanism for maintaining reliability, availability and performance of Amazon RDS. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | 1.1 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | 6.2, 6.3, 6.5, 8.2 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | 14.4 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | 6.2, 6.3, 6.5, 8.2 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-audit-logging-enabled | 8.2 | Enabling audit logging allows for the recording of activity occurring in Amazon Redshift clusters to CloudWatch or S3. This information can be used for analytics, monitoring, alerting, anomaly detection or for use in investigating security events. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-configuration-check | 8.2 | AWS does not capture database-level logs since they are not API calls, and therefore, are not captured in CloudTrail. To log user activity within the database application, Redshift audit logging must be enabled to capture logs for monitoring suspicious activity within the database. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-default-admin-check | 4.7 | Default credential should be changed after initial setup, to reduce the risks of unauthorized access and potential data breaches due to default or shared credentials. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | 4.7 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | 8.2 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | 3.3 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | 6.5 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | 1.1 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| route53-hosted-zone-tagged | 1.1 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | 8.2 | Enabling S3 bucket logging on target S3 buckets allows you to capture all events that might affect objects in a target bucket. Configuring logs to be placed in a separate bucket enables access to log information, which can be useful in security and incident response workflows and provides redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-tagged | 1.1 | Tagging S3 buckets is essential for effective resource managemen t, cost allocation, and governance. Tags enable organizat ions to categorize buckets by purpose, owner, environment, or project, facilitat ing accurate cost tracking and billing. Proper tagging also supports automated resource managemen t, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-last-backup-recovery-point-created | 11.2 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | 3.4, 8.1 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | 3.4, 8.1 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | 1.1 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | 1.1 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | 3.3 | Enabling network isolation for an Amazon SageMaker AI hosted model prevents the model container from making inbound or outbound network calls, including to AWS services and the internet. This containment reduces the risk of data exfiltration and of a compromised or malicious model communicating with external endpoints, strengthening the isolation of inference workloads that process sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | 1.1 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | 1.1 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-root-volume-encryption-enabled | 3.4 | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | 3.4 | User volume encryption is crucial for protecting sensitive user data in virtual desktop environments. Without encryption, user files and data could be exposed if storage systems are compromised. Implementing user volume encryption provides necessary protection for end-user data. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | 1.1 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## CIS Critical Security Controls v8 - Implementation Group 2 (IG2)

This AWS Config managed conformance pack provides a curated mapping between the Center for Internet Security (CIS) Critical Security Controls Version 8 Implementation Group 2 (IG2) safeguards and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more CIS safeguards. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** CIS_V8_IG2

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 253 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-http-to-https-redirection-check | 3.10 | By forcing redirecti on from HTTP to the secure HTTPs protocol, data is encrypted in transit in both directions: going to and coming from the origin server to maintain confident iality and prevent malicious actors from unauthorized access to sensitive data such as user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-listener-tagged | 1.1 | Proper tagging of ALB listeners enables effective resource | Available in all commercial Regions except Asia Pacific |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibility and enable automated resource lifecycle management through tag-based policies. | (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | 1.1 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | 16.1 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gwv2-access-logs-enabled | 8.7 | API Gateway access logs can provide detailed information about who has accessed your API and how the caller accessed the API. These logs are essential for security, audits and forensics investigations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | 6.2, 6.3, 8.2, 8.5, 8.7 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | 1.1 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | 1.1 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | 1.1, 2.1 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | 1.1, 2.1 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | 4.1 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | 1.1, 2.1 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | 1.1, 2.1 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | 1.1 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | 1.1, 2.1 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | 13.4 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | 1.1, 2.1 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | 1.1, 2.1 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | 3.10 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | 8.2, 8.5 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | 1.1, 2.1 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | 3.10 | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | 8.2, 8.5 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | 1.1, 2.1 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | 1.1, 2.1 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | 1.1, 1.4, 2.1 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | 12.2, 13.4 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | 12.2 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | 8.2, 8.5 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appstream-fleet-in-vpc | 12.2 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configuration supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | 14.8, 3.11 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | 14.4, 3.10 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | 14.8, 3.11 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | 8.2, 8.5 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | 6.2, 6.3, 8.2, 8.5, 8.7 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | 3.11 | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | 4.1 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | 6.2, 6.3, 6.5, 8.2, 8.5 | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| aurora-mysql-cluster-audit-logging | 8.2, 8.5, 8.9 | Database logs can assist with security and access audits and help diagnose availability issues. Audit logs capture a record of database activity, including login attempts, data modifications, schema changes, and other events that can be audited for security and compliance purposes. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-resources-in-logically-air-gapped-vault | 14.1, 3.12 | Logical air-gapping is essential for protecting critical database systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical database resources. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| backup-plan-min-frequency-and-min-retention-check | 11.2 | Data loss can occur if recovery points expire before a defined retention period. By configuring the frequency of backup and retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| backup-recovery-point-encrypted | 3.11 | Encrypting data at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | 4.1 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | vulnerabilities or operational issues. | |
| cloudfront-accesslogs-enabled | 8.7 | Without CloudFront logs, detailed records of requests will not be available to review and investigate any anomalies that may have occurred. Ensuring access logging cannot be disabled will provide assurance that the data cannot be tampered should a security incident occur for further investigation and remediation. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-custom-ssl-certificate | 3.10 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | 3.10 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudfront-traffic-to-origin-encrypted | 3.10 | Encrypting traffic between CloudFron t distribution and its custom origin will ensure that the environme nt is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-viewer-policy-https | 3.10 | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudtrail-all-read-s3-data-event-check | 6.2, 6.3, 6.5, 8.2, 8.5 | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-all-write-s3-data-event-check | 8.2, 8.5 | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-bucket-access-logging | 8.2, 8.5 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudtrail-s3-bucket-public-access-prohibited | 3.3 | Protecting CloudTrail logs from public access is essential for maintaining the security of audit data. Public exposure of audit logs could reveal sensitive information about your infrastructure and operations. Implementing strict access controls prevents unauthorized access to critical security information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-data events-enabled | 8.2, 8.5 | Logging data events on S3 buckets is an important piece of maintaining the reliability, availabil ity, and performan ce of Amazon S3 and your AWS solutions. Collecting monitoring data for object-level requests supports your Incident Response plan by allowing you to identify potential issues and respond on a timely manner; or to provide valuable data for forensics, auditing, and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudwatch-metric-stream-tagged | 1.1 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources , tracking ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | 8.2, 8.5, 8.6, 8.7, 8.8, 8.9 | Enabling CloudTrail provides essential visibility into your AWS environment by recording API activity and changes, aiding in security monitoring, compliance audits, and troubleshooting incidents. It enhances accountability, enables rapid incident response, and facilitates thorough forensic analysis of events within your cloud infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | 3.11 | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-encrypted-at-rest | 3.11 | Encrypting CodeBuild report groups is crucial for protecting sensitive build and test information. Unencrypted report data could be exposed if storage systems are compromised. Implementing encryption adds an essential layer of security for build and test results. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | 1.1 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | 7.1 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-ec2-minimum-healthy-hosts-configured | 12.2 | Maintaining a minimum number of healthy hosts during deployments is critical for application availability. Without this safeguard, deployments could potentially disrupt all instances simultaneously, causing service outages. Configuring minimum healthy hosts helps maintain service continuity during updates. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | 1.1 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | 8.2, 8.5, 8.7, 8.9 | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cw-loggroup-retention-period-check | 8.1 | Configuring retention periods for Amazon CloudWatch log groups ensures that data is kept for the required duration, to meet organizational compliance requirements, and allows the review and investigation of suspicious activities. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | 3.10 | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |
| datasync-task-logging-enabled | 8.2, 8.5 | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-encryption-enabled | 3.11 | Encrypting DynamoDB Accelerator Clusters at rest is essential to safeguard sensitive information and maintain data confidentiality. By employing encryption, organizations can thwart unauthorized access to data, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Spain), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | 3.10 | Enabling encryption in transit protects DAX cluster data from unauthorized access during transmission over networks, maintaining data confidentiality. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| dms-endpoint-ssl-configured | 3.10 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | 1.1 | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | docdb-cluster-encrypted-in-transit | 3.10 | Encryption in transit protects sensitive data as it moves between DocumentDB clients and clusters, preventing unauthorized interception and eavesdropping on database communications. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transmission. Enabling TLS encryption ensures that database credentials, queries, and results remain confidential and maintain integrity during network transmission. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-table-encrypted-kms | 3.11 | Encryption of data at rest in DynamoDB is enabled by default. Using AWS KMS reduces the operational complexity of managing encryption keys by integrating transparently with DynamoDB. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-table-encryption-enabled | 3.11 | Provide data security and privacy by ensuring encryption is enabled for your DynamoDB tables. | Available in all commercial Regions except Asia Pacific (New Zealand). Available in the AWS GovCloud (US) Regions. |
| ebs-resources-in-logically-air-gapped-vault | 12.2 | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | 1.1 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | 1.1 | Proper tagging of EC2 carrier gateways is essential for resource managemen t, cost allocatio n, access control, operational visibilit y. Tags enable organizations to categorize track network infrastru cture component s, implement automated governance policies, maintain complianc e with organizat ional standards. Consistent tagging practices facilitat e resource identific ation, billing attributi on, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | 1.1 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | --- | --- | --- | --- |
| ec2-ebs-encryption-by-default | 3.11 | Sensitive data can exist at rest on EBS volumes. All sensitive data should be protected at rest using strong cryptography, to protect the confidentiality and integrity of information and prevent and protect data in storage. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | 13.4, 4.4 | Source/destination checking for Amazon EC2 instances and attached ENIs should be enabled and configured consistently across your EC2 instances. Each ENI has its own setting for source/destination checks. If source/destination checking is enabled, Amazon EC2 enforces source/destination address validation, which ensures that an instance is either the source or the destination of any traffic that it receives. This provides an additional layer of network security by preventing resources from handling unintended traffic and preventing IP address spoofing. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | 1.1 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | 4.1 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | 4.3, 4.6 | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | 7.3 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | 1.1 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | ec2-spot-fleet-request-ct-encryption-at-rest | 3.11, 3.6 | For an additional layer of security, you should enable encryption for Amazon EBS volumes. Encryption operations then occur on the servers that host Amazon EC2 instances, which helps ensure the security of both data at rest and data in transit between an instance and its attached EBS storage. Amazon EBS encryption is a straightforward encryption solution for EBS resources associated with your EC2 instances. With EBS encryption, you arent required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | 1.1 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | 8.2, 8.5, 8.7 | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | 1.1 | Proper tagging of VPN connections enables effective resource management, cost allocation, governance oversight. Tags facilitate automated operations, security policies, compliance reporting by providing metadata that identifies resource ownership, purpose, environment, other critical attributes. Consistent tagging practices improve operational visibility support organizational policies for resource lifecycle management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | 7.5 | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabilities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | 1.1 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | 1.1 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | 12.2 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | 11.2 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-filesystem-ct-encrypted | 3.11 | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryption, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | 1.1 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | 12.2, 3.3 | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-resources-in-logically-air-gapped-vault | 3.12 | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | 1.1 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operation al visibility. Tags enable organizat ions to categoriz e track add-ons by environment, owner, project, or cost center, facilitat ing accurate billing resource governanc e. Consistent tagging practices support automated management workflows, security policies, complianc e reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernete s infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | 8.2, 8.5 | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | 3.11 | When you encrypt secrets, you can use AWS Key Managemen t Service (AWS KMS) keys to provide envelope encryptio n of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryptio n for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applicati ons by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | 11.2 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | 3.10 | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | 13.4 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | 1.1 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | 3.10 | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | 3.11 | Encryption at rest for Amazon EMR clusters protects sensitive data stored on cluster instances from unauthorized access. This control helps ensure compliance with data protection regulations and security best practices by detecting EMR configurations that lack proper encryption settings. Monitoring encryption configuration helps prevent data exposure risks and maintains data confidentiality for big data processing workloads. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | 3.10 | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). | --- | --- | --- | --- |
| glb-listener-tagged | 1.1 | Proper tagging of Gateway Load Balancer listeners enables effective resource managemen t, cost allocatio n, operational governance. Tags provide essential metadata for tracking resource ownership, environment classific ation, billing attributi on, automated management processes. Consisten t tagging practices improve visibility into network infrastru cture components, facilitate complianc e reporting, support security policies that rely on resource categorization. Without proper tagging, organizat ions lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | 1.1 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | 8.2 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | 3.11 | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | 13.1 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | 13.1, 13.2 | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | visibility in containerized environments meeting compliance requirements for runtime threat detection. | |
| guardduty-eks-protection-audit-enabled | 8.11, 8.2, 8.5 | GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious or malicious activity in your Amazon EKS clusters, such as unauthorized API calls, privilege escalation, and configuration tampering. Enabling it provides continuous threat detection for the container control plane so that compromises can be identified and investigated quickly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | 13.2, 13.3, 8.2, 8.5 | Runtime monitoring is essential for detecting and responding to security threats in containerized environments. Without runtime monitoring, organizations may be unable to detect container-level security incidents in real-time. Implementing automated runtime monitoring enhances container security posture. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-enabled-centralized | 13.3 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| guardduty-lambda-protection-enabled | 13.1, 13.2, 13.3 | Lambda Protection is crucial for maintaining security visibility in serverless architectures. Without this feature, organizations may miss potential security threats targeting their Lambda functions. Enabling Lambda Protection provides enhanced security monitoring for serverless workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | 10.1, 10.2, 10.6, 10.7, 8.2, 8.5 | Malware Protection is essential for maintaining a strong security posture against malicious software. Without this feature, organizations may be vulnerable to undetected malware threats. Implementing Malware Protection enhances threat detection capabilities across AWS resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | 13.1 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the RDS Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty RDS Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | 13.1, 13.2 | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | 13.1 | Amazon GuardDuty S3 Protection analyzes S3 data-plane events (such as GetObject, PutObject, and DeleteObject) to detect potentially malicious or anomalous access to your S3 data, including credential misuse and data exfiltration. Enabling S3 Protection extends GuardDuty threat detection to your object storage so suspicious activity against sensitive data can be identified and investigated promptly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | 1.1 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | 5.2 | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | 4.7 | Root user should not routinely access the AWS account. The access key for your AWS account root user gives full access to all your resources for all AWS services, including your billing informati on. You can't reduce the permissions associated with your AWS account root user access key. This helps to minimize potential unwanted or even unauthori zed changes to the environment, which could result in a negative impact to the business. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | 1.1 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | 1.1 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-mfa-enabled | 6.5 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | 5.3 | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | 7.5 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | 7.5, 7.6 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | 16.1, 7.5, 7.6 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | 7.5 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| iotdevicedefender-custom-metric-tagged | 1.1 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iotsitewise-asset-model-tagged | 2.1 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | 2.1 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iotsitewise-gateway-tagged | 2.1 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | 2.1 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | 2.1 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industria l IoT initiatives. Without proper tagging, organizat ions may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| kinesis-firehose-delivery-stream-encrypted | 3.11 | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | 3.4 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | 5.4 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | 1.1 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | 13.1, 8.2, 8.5, 8.9 | AWS X-Ray can provide tracing and monitoring capabilities for AWS Lambda functions, which can save time and effort debugging and operating Lambda functions. It can help you diagnose errors and identify performance bottlenecks, slowdowns, and timeouts by breaking down latency for Lambda functions. It can also help with data privacy and compliance requirements. If you enable active tracing for a Lambda function, X-Ray provides a holistic view of data flow and processing within the Lambda function, which can help you identify potential security vulnerabilities or non-compliant data handling practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| mq-auto-minor-version-upgrade-enabled | 7.4 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | 8.2, 8.5 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-log-enabled | 8.2 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | 3.3 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | maintain the integrity of your resources. | |
| msk-connect-connector-logging-enabled | 8.2, 8.5 | Enabling logging for an Amazon MSK connector captures operational and error events needed to detect anomalous behavior, troubleshoot failures, and support security investigations. Without connector logs, malicious or erroneous activity can go unnoticed and forensic analysis is limited. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | 6.3, 6.4, 6.5 | Disabling unauthenticated access to Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. Unauthenticated access can lead to data breaches, unauthorized data consumption or production, and potential compliance violations. Implementing proper authentication mechanisms ensures that only authorized users and applications can interact with Kafka topics and helps maintain audit trails for access monitoring and compliance reporting. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| multi-region-cloudtrail-enabled | 8.2 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilities, and proactive security monitoring. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | 3.11 | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | 12.2, 4.1, 4.2 | Enabling subnet change protection on Network Firewall instances prevents unauthorized modifications to firewall subnet associations, which could compromise network security boundaries and traffic inspection capabilities. This protection helps maintain the integrity of network segmentation policies and ensures that firewall rules continue to be applied to the intended network traffic flows. Without this protection, malicious actors or accidental configuration changes could bypass security controls by modifying subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | 12.2 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | 8.2, 8.5, 8.7 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | 1.1 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| rds-aurora-postgresql-logs-to-cloudwatch | 8.2, 8.5 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| rds-cluster-default-admin-check | 4.7 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-encrypted-at-rest | 3.11 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| rds-event-subscription-tagged | 1.1 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-default-admin-check | 4.7 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-logging-enabled | 8.2, 8.5 | Enabling logging for RDS helps monitor the environment to detect potential suspicious activity and unauthorized access to data. Amazon RDS logs are sent to CloudWatch for redundancy. RDS logging provides a mechanism for maintaining reliability, availability and performance of Amazon RDS. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | 3.10 | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | 3.10 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-option-group-tagged | 1.1 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | 6.2, 6.3, 6.5, 8.2, 8.5 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | 14.4, 3.10 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | 3.10 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | 3.10 | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | 6.2, 6.3, 6.5, 8.2, 8.5 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | 3.11 | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-audit-logging-enabled | 8.2, 8.5 | Enabling audit logging allows for the recording of activity occurring in Amazon Redshift clusters to CloudWatch or S3. This information can be used for analytics, monitoring, alerting, anomaly detection or for use in investigating security events. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-configuration-check | 3.11, 8.2, 8.5 | AWS does not capture database-level logs since they are not API calls, and therefore, are not captured in CloudTrail. To log user activity within the database application, Redshift audit logging must be enabled to capture logs for monitoring suspicious activity within the database. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-kms-enabled | 3.11 | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-subnet-group-multi-az | 12.2 | Multi-AZ subnet configuration is crucial for maintaining high availability and disaster recovery capabilities. Without subnets in multiple AZs, Redshift clusters are vulnerable to single-zone failures. Implementing a multi-AZ subnet strategy enhances cluster resilience and availability. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-default-admin-check | 4.7 | Default credential should be changed after initial setup, to reduce the risks of unauthorized access and potential data breaches due to default or shared credentials. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-require-tls-ssl | 3.10 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | 16.10, 4.7 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | 8.2, 8.5, 8.9 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | 3.10 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | 3.3 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | 12.2 | If enhanced VPC routing is disabled for an Amazon Redshift Serverless workgroup, Amazon Redshift routes traffic through the internet, including traffic to other services within the AWS network. If you enable enhanced VPC routing for a workgroup, Amazon Redshift forces all COPY and UNLOAD traffic between your cluster and your data repositories through your virtual private cloud (VPC) based on the Amazon VPC service. With enhanced VPC routing, you can use standard VPC features to control the flow of data between your Amazon Redshift cluster and other resources. This includes features such as VPC security groups and endpoint | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | policies, network access control lists (ACLs), and Domain Name System (DNS) servers. You can also use VPC flow logs to monitor COPY and UNLOAD traffic. | |
| redshift-unrestricted-port-access | 12.2, 13.4 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implement ing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | 6.5 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | 1.1 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | 1.1 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-query-logging-enabled | 8.6 | Enabling logging includes information such as the domain or subdomain that was queried, the date and time of the query, the DNS record type, and the DNS response code. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| s3-access-point-in-vpc-only | 12.2 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | 8.2, 8.5, 8.7 | Server access logging provides a mechanism to detect potential cybersecurity events, unauthorized access and suspicious activity. Each access log record provides details about a single access request and contains the requester, bucket name, request time, request action, response status, and an error code, if relevant. Server access logs are sent from a source bucket to a chosen target S3 bucket in the same AWS Region to ensure redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-read-prohibited | 12.2 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | 12.2 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | 3.11 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-ssl-requests-only | 3.10 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-tagged | 1.1 | Tagging S3 buckets is essential for effective resource management, cost allocation, and governance. Tags enable organizations to categorize buckets by purpose, owner, environment, or project, facilitating accurate cost tracking and billing. Proper tagging also supports automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-default-encryption-kms | 3.11 | Protecting objects in S3 using encryption at rest with KMS prevents unauthorized access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-last-backup-recovery-point-created | 11.2 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-lifecycle-policy-check | 3.4, 8.1 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-in-logically-air-gapped-vault | 12.2, 3.12 | Logical air-gapping is essential for protecting critical S3 data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical S3 bucket data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | 3.4, 8.1 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | 12.2 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | 1.1 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-config-prod-instance-count | 12.2 | Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architect ure. High availabil ity helps you to recover from security incidents. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | 1.1 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | 12.2 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | 12.2, 3.3 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | 13.1 | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | 1.1 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | 3.3 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-dlq-check | 16.10 | Dead letter queues are essential for robust message processing architectures as they provide a mechanism to isolate and examine messages that repeatedly fail processing. Without DLQ configuration, failed messages may be lost permanently or continue consuming processing resources through infinite retry loops. This control helps ensure message durability, enables debugging of processing failures, prevents resource exhaustion from problematic messages, and supports compliance requirements for data retention and audit trails in distributed systems. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | 3.3 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | 3.3 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | 3.3 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | 8.2, 8.5, 8.9 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | 1.1 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | 11.2 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | 13.6 | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. These logs can be used to respond quickly to anomalous traffic and can aid in incident response investigations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | 12.2 | Controlling inbound access to sensitive ports is crucial for maintaining network security. Unrestricted access to ports like SSH (22) or RDP (3389) could lead to unauthorized system access and potential breaches. Implementing strict port access controls helps prevent unauthorized access to resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-logging-enabled | 8.7 | Activity logs generated by Web ACL, in AWS Web Application Firewall actions, can provide useful operational troubleshooting and improvement information to application owners, looking to improve the underlying applications protected by the WAF service. The logs can also be beneficial if false positive blocking actions have been reported. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| wafv2-rulegroup-not-empty | 13.1 | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-classic-logging-enabled | 8.7 | Activity logs generated by Web ACL, in AWS Web Application Firewall actions, can provide useful operation al troubleshooting and improveme nt information to application owners, looking to improve the underlying applicati ons protected by the WAF service. The logs can also be beneficia l if false positive blocking actions have been reported. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-rulegroup-not-empty | 13.1, 8.7 | AWS Web Application Firewall (WAF) Classic global rule groups, without any configured rules, will not inspect or filter web traffic, potentially allowing malicious or unauthorized traffic to pass through. Configuring rules enables traffic inspection and enforcement of security policies. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | 1.1 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| workspaces-root-volume-encryption-enabled | 3.11, 3.4 | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | 3.11, 3.4 | User volume encryption is crucial for protecting sensitive user data in virtual desktop environments. Without encryption, user files and data could be exposed if storage systems are compromised. Implementing user volume encryption provides necessary protection for end-user data. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | 1.1 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## CIS Critical Security Controls v8 - Implementation Group 3 (IG3)

This AWS Config managed conformance pack provides a curated mapping between the Center for Internet Security (CIS) Critical Security Controls Version 8 Implementation Group 3 (IG3) safeguards and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more CIS safeguards. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** CIS_V8_IG3

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 259 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-http-to-https-redirection-check | 3.10 | By forcing redirecti on from HTTP to the secure HTTPs protocol, data is encrypted in transit in both directions: going to and coming from the origin server to maintain confident iality and prevent malicious actors from unauthorized access to sensitive data such as user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-listener-tagged | 1.1 | Proper tagging of ALB listeners enables effective resource | Available in all commercial Regions except Asia Pacific |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibility and enable automated resource lifecycle management through tag-based policies. | (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | 1.1 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | 16.1 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gwv2-access-logs-enabled | 8.7 | API Gateway access logs can provide detailed information about who has accessed your API and how the caller accessed the API. These logs are essential for security, audits and forensics investigations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | 6.2, 6.3, 8.2, 8.5, 8.7 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | 1.1 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | 1.1 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | 1.1, 2.1 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | 1.1, 2.1 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | 4.1 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | 1.1, 2.1 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | 1.1, 2.1 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | 1.1 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | 1.1, 2.1 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | 13.4 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | 1.1, 2.1 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | 1.1, 2.1 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | 3.10 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | 8.2, 8.5 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | 1.1, 2.1 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | 3.10 | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | 8.2, 8.5 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | 1.1, 2.1 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | 1.1, 2.1 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | 1.1, 1.4, 1.5, 2.1 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | 12.2, 13.4 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | 12.2 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | 8.2, 8.5 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appstream-fleet-in-vpc | 12.2 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configura tion supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastru cture. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | 14.8, 3.11 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | 14.4, 3.10 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | 14.8, 3.11 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | 8.12, 8.2, 8.5 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | 6.2, 6.3, 8.2, 8.5, 8.7 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | 3.11 | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | 4.1 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | 6.2, 6.3, 6.5, 8.2, 8.5 | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| aurora-mysql-cluster-audit-logging | 3.14, 8.2, 8.5, 8.9 | Database logs can assist with security and access audits and help diagnose availability issues. Audit logs capture a record of database activity, including login attempts, data modifications, schema changes, and other events that can be audited for security and compliance purposes. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-resources-in-logically-air-gapped-vault | 14.1, 3.12 | Logical air-gapping is essential for protecting critical database systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical database resources. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| backup-plan-min-frequency-and-min-retention-check | 11.2 | Data loss can occur if recovery points expire before a defined retention period. By configuring the frequency of backup and retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-encrypted | 3.11 | Encrypting data at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | 4.1 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | vulnerabilities or operational issues. | |
| cloudfront-accesslogs-enabled | 8.7 | Without CloudFront logs, detailed records of requests will not be available to review and investigate any anomalies that may have occurred. Ensuring access logging cannot be disabled will provide assurance that the data cannot be tampered should a security incident occur for further investigation and remediation. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-custom-ssl-certificate | 3.10 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | 3.10 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-traffic-to-origin-encrypted | 3.10 | Encrypting traffic between CloudFron t distribution and its custom origin will ensure that the environme nt is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-viewer-policy-https | 3.10 | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudtrail-all-read-s3-data-event-check | 6.2, 6.3, 6.5, 8.2, 8.5 | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-all-write-s3-data-event-check | 3.14, 8.2, 8.5 | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-bucket-access-logging | 8.2, 8.5 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudtrail-s3-bucket-public-access-prohibited | 3.3 | Protecting CloudTrail logs from public access is essential for maintaining the security of audit data. Public exposure of audit logs could reveal sensitive information about your infrastructure and operations. Implementing strict access controls prevents unauthorized access to critical security information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-data events-enabled | 3.14, 8.2, 8.5 | Logging data events on S3 buckets is an important piece of maintaining the reliability, availabil ity, and performan ce of Amazon S3 and your AWS solutions. Collecting monitoring data for object-level requests supports your Incident Response plan by allowing you to identify potential issues and respond on a timely manner; or to provide valuable data for forensics, auditing, and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-metric-stream-tagged | 1.1 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources , tracking ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | 8.12, 8.2, 8.5, 8.6, 8.7, 8.8, 8.9 | Enabling CloudTrail provides essential visibility into your AWS environment by recording API activity and changes, aiding in security monitoring, compliance audits, and troubleshooting incidents. It enhances accountability, enables rapid incident response, and facilitates thorough forensic analysis of events within your cloud infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | 3.11 | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-encrypted-at-rest | 3.11 | Encrypting CodeBuild report groups is crucial for protecting sensitive build and test information. Unencrypted report data could be exposed if storage systems are compromised. Implementing encryption adds an essential layer of security for build and test results. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | 1.1 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | 7.1 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-ec2-minimum-healthy-hosts-configured | 12.2 | Maintaining a minimum number of healthy hosts during deployments is critical for application availability. Without this safeguard, deployments could potentially disrupt all instances simultaneously, causing service outages. Configuring minimum healthy hosts helps maintain service continuity during updates. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | 1.1 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | 8.12, 8.2, 8.5, 8.7, 8.9 | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cw-loggroup-retention-period-check | 8.1 | Configuring retention periods for Amazon CloudWatch log groups ensures that data is kept for the required duration, to meet organizational compliance requirements, and allows the review and investigation of suspicious activities. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | 3.10 | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |
| datasync-task-logging-enabled | 8.2, 8.5 | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| dax-encryption-enabled | 3.11 | Encrypting DynamoDB Accelerator Clusters at rest is essential to safeguard sensitive information and maintain data confidentiality. By employing encryption, organizations can thwart unauthorized access to data, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Spain), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | 3.10 | Enabling encryption in transit protects DAX cluster data from unauthorized access during transmission over networks, maintaining data confidentiality. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| dms-endpoint-ssl-configured | 3.10 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | 1.1 | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | 1.1 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | 1.1 | Proper tagging of EC2 carrier gateways is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize track network infrastructure components, implement automated governance policies, maintain compliance with organizational standards. Consistent tagging practices facilitate resource identification, billing attribution, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | 1.1 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-ebs-encryption-by-default | 3.11 | Sensitive data can exist at rest on EBS volumes. All sensitive data should be protected at rest using strong cryptography, to protect the confidentiality and integrity of information and prevent and protect data in storage. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | 13.4, 4.4 | Source/destination checking for Amazon EC2 instances and attached ENIs should be enabled and configured consistently across your EC2 instances. Each ENI has its own setting for source/destination checks. If source/destination checking is enabled, Amazon EC2 enforces source/destination address validation, which ensures that an instance is either the source or the destination of any traffic that it receives. This provides an additional layer of network security by preventing resources from handling unintended traffic and preventing IP address spoofing. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | 1.1 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | 4.1 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | 4.3, 4.6 | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | 7.3 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | 1.1 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-tagged | 1.1 | Proper tagging of Network Insights access scopes enables effective resource management, cost allocation, governance across AWS environments. Tags provide essential metadata for tracking resource ownership, purpose, lifecycle management. Consistent tagging practices support automated operations, security policies, compliance reporting requirements. Without adequate tagging, organizations lose visibility into resource utilization patterns struggle to implement effective cost controls access management policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-path-tagged | 1.1 | Proper tagging of Network Insights paths enables effective resource management, cost allocation, operational governance. Tags facilitate automated resource discovery, support compliance reporting requirements, enable consistent application of organizational policies across network analysis resources. Without standardized tagging, organizations lose visibility into resource ownership, purpose, associated costs, making it difficult to maintain operational control meet regulatory requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-in-logically-air-gapped-vault | 12.2 | Logical air-gapping is essential for protecting critical compute resources from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive systems. Implementing air-gapping provides an additional security barrier for critical EC2 instances. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | 3.11, 3.6 | For an additional layer of security, you should enable encryption for Amazon EBS volumes. Encryption operations then occur on the servers that host Amazon EC2 instances, which helps ensure the security of both data at rest and data in transit between an instance and its attached EBS storage. Amazon EBS encryption is a straightforward encryption solution for EBS resources associated with your EC2 instances. With EBS encryption, you arent required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | 1.1 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | 8.2, 8.5, 8.7 | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | 1.1 | Proper tagging of VPN connections enables effective resource management, cost allocation, governance oversight. Tags facilitate automated operations, security policies, compliance reporting by providing metadata that identifies resource ownership, purpose, environment, other critical attributes. Consistent tagging practices improve operational visibility support organizational policies for resource lifecycle management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | 7.5 | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabi lities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applicati ons. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | 1.1 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | 1.1 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | 12.2 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | 11.2 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-filesystem-ct-encrypted | 3.11 | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryption, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | 1.1 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | 12.2, 3.3 | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-resources-in-logically-air-gapped-vault | 3.12 | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | 1.1 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operation al visibility. Tags enable organizat ions to categoriz e track add-ons by environment, owner, project, or cost center, facilitat ing accurate billing resource governanc e. Consistent tagging practices support automated management workflows, security policies, complianc e reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernete s infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | 8.2, 8.5 | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | 3.11 | When you encrypt secrets, you can use AWS Key Managemen t Service (AWS KMS) keys to provide envelope encryptio n of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryptio n for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applicati ons by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | 11.2 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-rbac-auth-enabled | 6.8 | RBAC authentication provides fine-grained access control for Redis clusters. Without RBAC, managing access to cache resources could be less secure and more difficult to maintain. Implementing RBAC ensures proper authentication and authorization for cache access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | 3.10 | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | 13.4 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | 1.1 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | 3.10 | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | 3.11 | Encryption at rest for Amazon EMR clusters protects sensitive data stored on cluster instances from unauthorized access. This control helps ensure compliance with data protection regulations and security best practices by detecting EMR configurations that lack proper encryption settings. Monitoring encryption configuration helps prevent data exposure risks and maintains data confidentiality for big data processing workloads. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | 3.10 | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| glb-tagged | 1.1 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | 8.2 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | 3.11 | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | 13.1, 3.14 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-ecs-protection-runtime-enabled | 13.1, 13.2, 3.14 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon ECS clusters on AWS Fargate. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-audit-enabled | 8.11, 8.2, 8.5 | GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious or malicious activity in your Amazon EKS clusters, such as unauthorized API calls, privilege escalation, and configuration tampering. Enabling it provides continuous threat detection for the container control plane so that compromises can be identified and investigated quickly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | 13.2, 13.3, 8.2, 8.5 | Runtime monitoring is essential for detecting and responding to security threats in containerized environments. Without runtime monitoring, organizations may be unable to detect container-level security incidents in real-time. Implementing automated runtime monitoring enhances container security posture. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-enabled-centralized | 13.3 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| guardduty-lambda-protection-enabled | 13.1, 13.2, 13.3 | Lambda Protection is crucial for maintaining security visibility in serverless architectures. Without this feature, organizations may miss potential security threats targeting their Lambda functions. Enabling Lambda Protection provides enhanced security monitoring for serverless workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | 10.1, 10.2, 10.6, 10.7, 8.2, 8.5 | Malware Protection is essential for maintaining a strong security posture against malicious software. Without this feature, organizations may be vulnerable to undetected malware threats. Implementing Malware Protection enhances threat detection capabilities across AWS resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | 13.1 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the RDS Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty RDS Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | 13.1, 13.2, 3.14 | In a multi-account environment, only the delegated GuardDuty administrator can enable or disable GuardDuty Runtime Monitoring for accounts in their organization. In addition, only the GuardDuty administrator can configure and manage the security agents that GuardDuty uses for runtime monitoring of AWS workloads and resources for accounts in the organization. GuardDuty member accounts cant enable, configure, or disable Runtime Monitoring for their own accounts. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | 13.1, 3.14 | Amazon GuardDuty S3 Protection analyzes S3 data-plane events (such as GetObject, PutObject, and DeleteObject) to detect potentially malicious or anomalous access to your S3 data, including credential misuse and data exfiltration. Enabling S3 Protection extends GuardDuty threat detection to your object storage so suspicious activity against sensitive data can be identified and investigated promptly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | 1.1 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iam-password-policy | 5.2 | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | 6.8 | The AWSCloudShellFullAccess managed policy grants broad permissions, including unrestricted file upload and download through AWS CloudShell, which can be used to exfiltrate data or introduce files into the environment. Attaching this policy violates least-privilege principles; grant only the specific CloudShell permissions required so the risk of data exfiltration and misuse is minimized. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | 4.7 | Root user should not routinely access the AWS account. The access key for your AWS account root user gives full access to all your resources for all AWS services, including your billing informati on. You can't reduce the permissions associated with your AWS account root user access key. This helps to minimize potential unwanted or even unauthori zed changes to the environment, which could result in a negative impact to the business. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | 1.1 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | 1.1 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-mfa-enabled | 6.5 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | 5.3 | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | 7.5 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | 7.5, 7.6 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | 16.1, 7.5, 7.6 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | 16.12, 7.5 | Standard Lambda scanning is essential for maintaining security in serverless architectures. Without regular scanning, organizations may miss potential vulnerabilities in their Lambda runtime environments. Implementing standard scanning helps ensure comprehensive Lambda function security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | 6.8 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | 3.11 | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | 3.4 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | 5.4 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | 1.1 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | 13.1, 8.2, 8.5, 8.9 | AWS X-Ray can provide tracing and monitoring capabilities for AWS Lambda functions, which can save time and effort debugging and operating Lambda functions. It can help you diagnose errors and identify performance bottlenecks, slowdowns, and timeouts by breaking down latency for Lambda functions. It can also help with data privacy and compliance requirements. If you enable active tracing for a Lambda function, X-Ray provides a holistic view of data flow and processing within the Lambda function, which can help you identify potential security vulnerabilities or non-compliant data handling practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| multi-region-cloudtrail-enabled | 8.2 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilities, and proactive security monitoring. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | 3.11 | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | 12.2, 4.1, 4.2 | Enabling subnet change protection on Network Firewall instances prevents unauthorized modifications to firewall subnet associations, which could compromise network security boundaries and traffic inspection capabilities. This protection helps maintain the integrity of network segmentation policies and ensures that firewall rules continue to be applied to the intended network traffic flows. Without this protection, malicious actors or accidental configuration changes could bypass security controls by modifying subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | 12.2 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | 8.2, 8.5, 8.7 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | 1.1 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | 12.2 | Configuring OpenSearch domains with at least three data nodes and multi-AZ enabled enhances availability, fault tolerance, scalability, performance, data resilience, and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). |---|---|---|---|
| rds-aurora-postgresql-logs-to-cloudwatch | 8.2, 8.5 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| rds-cluster-default-admin-check | 4.7 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-encrypted-at-rest | 3.11 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| rds-event-subscription-tagged | 1.1 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-default-admin-check | 4.7 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-logging-enabled | 8.2, 8.5 | Enabling logging for RDS helps monitor the environment to detect potential suspicious activity and unauthorized access to data. Amazon RDS logs are sent to CloudWatch for redundancy. RDS logging provides a mechanism for maintaining reliability, availability and performance of Amazon RDS. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | 3.10 | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-mysql-instance-encrypted-in-transit | 3.10 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | 1.1 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | 6.2, 6.3, 6.5, 8.2, 8.5 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | 14.4, 3.10 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | 3.10 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | 3.10 | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | 6.2, 6.3, 6.5, 8.2, 8.5 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | 3.11 | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-audit-logging-enabled | 8.2, 8.5 | Enabling audit logging allows for the recording of activity occurring in Amazon Redshift clusters to CloudWatch or S3. This information can be used for analytics, monitoring, alerting, anomaly detection or for use in investigating security events. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-configuration-check | 3.11, 3.14, 8.2, 8.5 | AWS does not capture database-level logs since they are not API calls, and therefore, are not captured in CloudTrail. To log user activity within the database application, Redshift audit logging must be enabled to capture logs for monitoring suspicious activity within the database. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-kms-enabled | 3.11 | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-subnet-group-multi-az | 12.2 | Multi-AZ subnet configuration is crucial for maintaining high availability and disaster recovery capabilities. Without subnets in multiple AZs, Redshift clusters are vulnerable to single-zone failures. Implementing a multi-AZ subnet strategy enhances cluster resilience and availability. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-default-admin-check | 4.7 | Default credential should be changed after initial setup, to reduce the risks of unauthorized access and potential data breaches due to default or shared credentials. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-require-tls-ssl | 3.10 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | 16.10, 4.7 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | 8.2, 8.5, 8.9 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | 3.10 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | 3.3 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | 12.2 | If enhanced VPC routing is disabled for an Amazon Redshift Serverless workgroup, Amazon Redshift routes traffic through the internet, including traffic to other services within the AWS network. If you enable enhanced VPC routing for a workgroup, Amazon Redshift forces all COPY and UNLOAD traffic between your cluster and your data repositories through your virtual private cloud (VPC) based on the Amazon VPC service. With enhanced VPC routing, you can use standard VPC features to control the flow of data between your Amazon Redshift cluster and other resources. This includes features such as VPC security groups and endpoint | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | policies, network access control lists (ACLs), and Domain Name System (DNS) servers. You can also use VPC flow logs to monitor COPY and UNLOAD traffic. | |
| redshift-unrestricted-port-access | 12.2, 13.4 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implement ing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | 6.5 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | 1.1 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | 1.1 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| route53-query-logging-enabled | 8.6 | Enabling logging includes information such as the domain or subdomain that was queried, the date and time of the query, the DNS record type, and the DNS response code. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| s3-access-point-in-vpc-only | 12.2 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | 8.2, 8.5, 8.7 | Server access logging provides a mechanism to detect potential cybersecurity events, unauthorized access and suspicious activity. Each access log record provides details about a single access request and contains the requester, bucket name, request time, request action, response status, and an error code, if relevant. Server access logs are sent from a source bucket to a chosen target S3 bucket in the same AWS Region to ensure redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-read-prohibited | 12.2 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | 12.2 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | 3.11 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-ssl-requests-only | 3.10 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-tagged | 1.1 | Tagging S3 buckets is essential for effective resource management, cost allocation, and governance. Tags enable organizations to categorize buckets by purpose, owner, environment, or project, facilitating accurate cost tracking and billing. Proper tagging also supports automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-default-encryption-kms | 3.11 | Protecting objects in S3 using encryption at rest with KMS prevents unauthorized access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-last-backup-recovery-point-created | 11.2 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-lifecycle-policy-check | 3.4, 8.1 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-in-logically-air-gapped-vault | 12.2, 3.12 | Logical air-gapping is essential for protecting critical S3 data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical S3 bucket data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | 3.4, 8.1 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | 12.2 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | 1.1 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-config-prod-instance-count | 12.2 | Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architect ure. High availabil ity helps you to recover from security incidents. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | 1.1 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | 12.2 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | 12.2, 3.3 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | 13.1 | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | 1.1 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ses-malware-scanning-enabled | 9.7 | Malware scanning in SES is crucial for protecting email workflows from potential security threats. Without scanning, malicious attachments or spam could infiltrate your systems. Implementing malware scanning helps maintain email security and prevents potential infections. | Available only in US East (N. Virginia), US West (Oregon), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| sns-topic-no-public-access | 3.3 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-dlq-check | 16.10 | Dead letter queues are essential for robust message processing architectures as they provide a mechanism to isolate and examine messages that repeatedly fail processing. Without DLQ configuration, failed messages may be lost permanently or continue consuming processing resources through infinite retry loops. This control helps ensure message durability, enables debugging of processing failures, prevents resource exhaustion from problematic messages, and supports compliance requirements for data retention and audit trails in distributed systems. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | 3.3, 6.8 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | 3.3, 6.8 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | 8.2, 8.5, 8.9 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | 1.1 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | 11.2 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-resources-in-logically-air-gapped-vault | 3.12 | Logical air-gapping is essential for protecting critical Storage Gateway data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical Storage Gateway volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-connector-logging-enabled | 8.12, 8.2, 8.5, 8.9 | Enabling CloudWatch logging for AWS Transfer Family Connectors is essential for maintaining operational visibility, security monitoring, compliance requirements. Comprehensive logging enables organizations to track file transfer activities, monitor connector performance, detect anomalous behavior, maintain audit trails for regulatory compliance. Without proper logging, organizations lose critical visibility into data transfer operations, making it difficult to troubleshoot issues, investigate security incidents, or demonstrate compliance with data governance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | 3.10 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-in-logically-air-gapped-vault | 11.1, 11.2 | Regular recovery point creation is crucial for maintaining volume data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of volume failures. Implementing regular backups provides a reliable mechanism for volume protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | 13.6 | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. These logs can be used to respond quickly to anomalous traffic and can aid in incident response investigations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | 12.2 | Controlling inbound access to sensitive ports is crucial for maintaining network security. Unrestricted access to ports like SSH (22) or RDP (3389) could lead to unauthorized system access and potential breaches. Implementing strict port access controls helps prevent unauthorized access to resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-logging-enabled | 8.7 | Activity logs generated by Web ACL, in AWS Web Application Firewall actions, can provide useful operational troubleshooting and improvement information to application owners, looking to improve the underlying applications protected by the WAF service. The logs can also be beneficial if false positive blocking actions have been reported. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-not-empty | 13.1 | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-classic-logging-enabled | 8.7 | Activity logs generated by Web ACL, in AWS Web Application Firewall actions, can provide useful operation al troubleshooting and improveme nt information to application owners, looking to improve the underlying applicati ons protected by the WAF service. The logs can also be beneficia l if false positive blocking actions have been reported. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-rulegroup-not-empty | 13.1, 8.7 | AWS Web Application Firewall (WAF) Classic global rule groups, without any configured rules, will not inspect or filter web traffic, potentially allowing malicious or unauthorized traffic to pass through. Configuring rules enables traffic inspection and enforcement of security policies. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | 1.1 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| workspaces-root-volume-encryption-enabled | 3.11, 3.4 | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | 3.11, 3.4 | User volume encryption is crucial for protecting sensitive user data in virtual desktop environments. Without encryption, user files and data could be exposed if storage systems are compromised. Implementing user volume encryption provides necessary protection for end-user data. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | 1.1 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## Cyber Risk Institute (CRI) Profile v2

This AWS Config managed conformance pack provides a curated mapping between the Cyber Risk Institute (CRI) Profile Version 2 diagnostic statements and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more CRI Profile diagnostic statements. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** CRI-PROFILE_V2

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 723 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| access-keys-rotated | PR.AA-01.01, PR.AA-05.03 | Rotating access keys will reduce the window of opportunity for an access key that is associated with a compromised or terminated account to be used. Access keys should be rotated to ensure that data cannot be accessed with an old key which might have been lost, cracked, or stolen. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | | in the AWS GovCloud (US) Regions. |
| account-part-of-organizations | ID.AM-08.02 | By enrolling and managing AWS accounts using AWS Organizations, enforcement and consistent security policies and controls are applied across all accounts within the organization. This ensures that security measures, such as access controls, encryption, and logging, are applied uniformly, reducing the risk of unauthorized access, data breaches, and compliance violations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| acm-certificate-expiration-check | PR.DS-02.01, PR.PS-01.06, PR.PS-01.07 | Expired certificates could allow malicious actors to impersonate legitimate entities, potentially leading to data breaches or other security incidents. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| acm-certificate-rsa-check | PR.PS-01.06 | Configuring a key length of at least 2,048 bits, protects the AWS resources and data encrypted today for many years into the future, as computing power becomes less expensive and servers become more advances. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| acm-certificate-transparent-logging-enabled | PR.PS-01.07 | AWS Certificate Manager submits issued certificates to public Certificate Transparency (CT) logs by default, enabling browsers and domain owners to detect mis-issued or fraudulent certificates. This detective check reports NON_COMPLIANT when CT logging is explicitly disabled. Keeping CT logging enabled supports external detectability of certificate mis-issuance; it does not constitute the organization's operational audit logging. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |
| acm-pca-root-ca-disabled | PR.PS-01.07 | Disabling the root CA reduces risk of unauthorized certificate issuance that could enable impersonation attacks or breaches of the certificate authority. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-http-drop-invalid-header-enabled | DE.CM-01.03, PR.IR-01.02, PR.IR-01.03, PR.PS-01.01, PR.PS-01.03 | Enabling the attribute Drop Invalid Header Fields security feature mitigates the risk of cross-site scripting (XSS) or server-side request forgery (SSRF) by dropping the invalid header fields protection backend instances from potential vulnerabilities. Dropping the invalid header fields ensures only properly formatted requests are forwarded to the backend instances reducing application failures or disruptions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-http-to-https-redirection-check | PR.DS-02.01, PR.PS-01.06 | By forcing redirecti on from HTTP to the secure HTTPs protocol, data is encrypted in transit in both directions: going to and coming from the origin server to maintain confident iality and prevent malicious actors from unauthorized access to sensitive data such as user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-internal-scheme-check | DE.CM-01.03, PR.IR-01.01, PR.IR-01.02, PR.IR-01.05 | Internal scheme configuration for Application Load Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. This configura tion helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requireme | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | nts that mandate network segmentat ion and controlled access to application infrastructure. | |
| alb-listener-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environme nts. Tags facilitate automated complianc e reporting, support billing transpare ncy by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibilit y and enable automated resource lifecycle managemen t through tag-based policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01, ID.AM-05.02 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| alb-waf-enabled | DE.CM-01.03, PR.IR-01.01, PR.IR-01.03 | AWS WAF helps protects your website from common attack techniques like SQL injection, Cross-Site Scripting (XSS), and block or rate-limit traffic from specific user-agents among other protections, to prevent malicious actors from exploitin g application security vulnerabilities. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | ID.AM-08.01, PR.PS-01.03 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-build-spec-configured | PR.PS-02.02 | Without an explicit build spec, Amplify uses auto-detected defaults, which means the build process isn't codified or version-controlled. This creates gaps in build integrity, secrets handling, and change management auditability. An explicit build spec ensures deployment commands are defined, scoped, and reviewable across all environments | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-description | PR.PS-06.08 | Requiring descriptions for AWS Amplify applications enhances operational visibility and governance by ensuring applications are properly documented. Descriptions provide essential context about application purpose, functionality, and ownership, which facilitates better resource management, troubleshooting, and compliance reporting. This practice supports organizational standards for resource documentation and helps teams quickly identify and understand deployed applications across the environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-no-environment-variables | PR.AA-01.01, PR.AA-05.03 | AWS Amplify environment variables are stored in app configuration and are visible to principals with console/API access, making them an unsafe place for secrets or sensitive configuration. Requiring an empty environment-variables list reduces the risk of exposed credentials and steers sensitive values to a managed secret store (e.g., AWS Secrets Manager / SSM Parameter Store). This detective check flags apps that carry any environment variables | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-tagged | ID.AM-02.01, ID.AM-05.01 | AWS Amplify apps are full-stack web and mobile applicati on projects hosted on AWS Amplify. Enforcing this control helps ensure those aws amplify apps have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded) . Consistent tagging makes aws amplify apps identifiable in an automated asset inventory, supports ownership accountab ility and cost allocatio n, and enables attribute-based access control (ABAC) where authoriza tion depends on matching resource and principal tags. Maintaining this | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderaba d), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | configuration reduces security risk for AWS Amplify resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |
| amplify-branch-auto-build-enabled | PR.PS-06.01, PR.PS-06.04, PR.PS-06.07 | Enforcing this control helps ensure AWS Amplify branches have auto build enabled. Maintaining this configuration reduces security risk for AWS Amplify resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-branch-description | PR.PS-06.08 | Enforcing this control helps ensure AWS Amplify branches have a description. Maintaining this configuration reduces security risk for AWS Amplify resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-branch-performance-mode-enabled | PR.IR-04.02 | Enabling performance mode on AWS Amplify branches optimizes application delivery by implementing advanced caching strategies, content compression, and edge optimization techniques. Performance mode reduces page load times, improves user experience, and can decrease bandwidth costs by serving optimized content from edge locations. Organizations should enable this feature to ensure their web applications meet performance standards and provide optimal user experiences across different geographic locations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-branch-tagged | ID.AM-02.01, ID.AM-05.01 | A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the IAM User Guide. For more information about tags, see the Tagging AWS Resources and | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | Tag Editor User Guide. Do not store personally identifia ble information (PII) or other confidential or sensitive informati on in tags. Tags are accessible from many AWS services. They arent intended to be used for private or sensitive data. | |
| apigatewayv2-integ ration-private-https-enabled | PR.DS-02.01, PR.PS-01.06 | VPC Links connect API Gateway to private resources . While VPC Links create private connectivity, they don't inherentl y encrypt data. Configuring TLS ensures use of HTTPS for end-to-end encryption from client through API Gateway to backend. Without TLS, sensitive API traffic flows unencrypt ed across private connections. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apigatewayv2-stage-description | PR.PS-06.08 | Requiring descriptions on API Gateway V2 stages ensures deployment environments are properly documented and identifiable. API Gateway stages represent deployment targets (e.g., dev, staging, production) that serve API traffic, without descriptions, teams lack visibility into the purpose and configuration context of each stage, making it difficult to verify that appropriate security configurations, throttling, and access controls are applied to the correct environment. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apigateway-domain-name-tls-check | PR.DS-02.01, PR.PS-01.06 | This control checks whether an API Gateway domain name is configure d to encrypt data in transit by using a recommended security policy. The control fails if the API Gateway domain name isnt configured to use a recommend ed security policy. A security policy is a predefined combinati on of minimum TLS version and cipher suites offered by API Gateway. When your clients establish a TLS handshake to your API or custom domain name, the security policy enforces the TLS version and cipher suite accepted by API Gateway. Security policies protect your APIs and custom domain names from network security problems such as tampering | Available in all commercial Regions except Asia Pacific (New Zealand). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | and eavesdropping between a client and server. Using a recommended security policy helps ensure that API Gateway domain names use modern, secure TLS configura tions that protect data in transit between clients and your API. | |
| apigateway-stage-a ccess-logs-enabled | PR.PS-04.02, PR.PS-04.03 | Enforcing this control helps ensure Amazon API Gateway stages have access logging enabled. Maintaini ng this configura tion reduces security risk for Amazon API Gateway resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apigateway-stage-description | PR.PS-06.08 | An API Gateway stage description is a free-text metadata field identifying the stage's purpose (e.g., environment or release). Populating it supports operational clarity, ownership, and change traceability across an organization's API estate, and makes stages easier to identify during review. This is a detective check: it reports NON_COMPLIANT when the description is absent or empty. Note this control verifies only that a description exist, it is an operational-hygiene check rather than a security-control enforcement. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| api-gwv2-access-logs-enabled | DE.AE-03.01, DE.CM-03.01, DE.CM-03.02, PR.PS-04.02, PR.PS-04.03 | API Gateway access logs can provide detailed information about who has accessed your API and how the caller accessed the API. These logs are essential for security, audits and forensics investigations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| api-gwv2-authorization-type-configured | PR.IR-01.02 | The API endpoint type can be edge-optimized, regional, or private, depending on where the majority of your API traffic originates from. Ensuring that the API endpoint is properly configured ensures that traffic is routed optimally and as required. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| api-gwv2-stage-default-route-detailed-metrics-enabled | DE.AE-03.01, PR.IR-04.01, PR.PS-04.02 | Enforcing this control helps ensure the default route settings for Amazon API Gateway V2 stages have detailed metrics enabled. Maintaining this configuration reduces security risk for Amazon API Gateway resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |
| api-gw-associated-with-waf | DE.CM-01.03, PR.IR-01.03 | Without WAF association, Amazon API Gateway is vulnerable to malicious web attacks such as SQL-Injection and Cross-site Scripting. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | PR.DS-01.01, PR.PS-01.06 | When caching is enabled, Amazon API Gateway service caches responses from API endpoint, reduces the number of calls made to an API endpoint and improves the latency of requests to the API. In addition, encrypted REST API caches protect data from unauthorized access. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| api-gw-execution-logging-enabled | DE.AE-02.01, DE.AE-03.02, DE.AE-07.02, DE.CM-03.01, DE.CM-03.02, DE.CM-03.03, PR.PS-04.02, PR.PS-04.03, RS.MA-02.01 | API Gateway logging provides detailed records of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-ssl-enabled | PR.DS-02.01, PR.PS-01.06, PR.PS-01.07 | Use SSL certificates with API Gateway to provide an additional layer of security. With this configuration, API Gateway authenticates HTTP requests and allows only those originating from API Gateway to access backend systems, even if the backend is publicly accessible. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| api-gw-xray-enabled | DE.AE-03.01, DE.AE-03.02, PR.PS-04.02 | X-Ray active tracing enables a more rapid response to performance changes in the underlying infrastructure and provides real-time metrics of user requests that flow through your API Gateway REST API operations and connected services. Changes in performance could result in a lack of availability of the API. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-description | PR.PS-01.01, PR.PS-01.03, PR.PS-06.08 | Requiring descriptions for AppConfig applications enhances operational visibility and governance by ensuring proper documentation of application purposes and configurations. Well-documented applications improve team collaboration, facilitate troubleshooting, support compliance auditing, and reduce the risk of misconfiguration or unintended changes to critical application settings. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | GV.OC-04.01, ID.AM-02.01 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | PR.PS-01.01, PR.PS-01.03 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-description | PR.PS-06.08 | Requiring descriptions for AppConfig deployment strategies enhances operational visibility and governance by ensuring deployment approaches are properly documented. Well-documented deployment strategies facilitate team collaboration, reduce configuration errors, and support compliance requirements by providing clear context about how application configurations are rolled out. This documentation becomes critical during incident response, audits, and knowledge transfer activities. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-minimum-final-bake-time | PR.PS-02.02 | AWS AppConfig deployment strategies use a final bake time to define how long the service monitors CloudWatch alarms after a configuration change has been fully rolled out, before declaring the deployment complete. During this window, AppConfig retains the ability to automatically roll back to the previous configuration version if an alarm fires. A bake time that is too short — or set to zero — closes this rollback window before application metrics, error rates, or latency anomalies have had sufficient time to surface, effectively disabling the primary automated recovery mechanism for bad configuration changes. This control enforces a minimum bake time | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | threshold across all deployment strategies, ensuring that no strategy prematurely closes the observation window. Configuration changes carry the same risk profile as code deployments but are often subject to less scrutiny; a misconfigured feature flag, throttle limit, or connection string can cause cascading failures that only become visible under real traffic load. By requiring a meaningful bake time, this control ensures that automated rollback remains available during the period when impact is most likely to be detected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-replicate-to-ssm | PR.PS-06.08 | Replicating AppConfig deployment strategies to Systems Manager documents provides centralized configuration management, enhanced auditability, and improved operational visibility. This practice enables teams to maintain consistent deployment patterns across environments, facilitates compliance reporting by creating auditable records of deployment configurations, and supports disaster recovery scenarios by ensuring deployment strategies are preserved in a managed service with built-in versioning and access controls. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-description | PR.PS-06.08 | Requiring descriptions for AppConfig environments enhances operational visibility and governance by ensuring proper documentation of configuration management resources. Well-documented environments facilitate troubleshooting, change management, and knowledge transfer among team members. This practice supports compliance requirements for maintaining adequate documentation of system components and helps prevent configuration drift by clearly identifying the purpose and scope of each environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | ID.AM-02.01 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-freeform-profile-config-storage | ID.AM-08.01, PR.DS-01.01, PR.PS-01.01 | Storing configuration data in approved AWS services ensures proper security controls, encryption, access management, and audit capabilities. AWS Secrets Manager provides automatic encryption, rotation capabilities, and fine-grained access controls for sensitive configuration data. AWS AppConfig hosted configuration store offers integrated security features and simplified management within the AppConfig service. Using unapproved storage locations may expose configuration data to security risks, lack proper encryption, or bypass organizational governance controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-hosted-configuration-version-description | PR.PS-06.08 | Requiring descriptions for AppConfig hosted configuration versions enhances operational visibility and change management practices. Meaningful descriptions help teams understand the purpose and impact of configuration changes, facilitate troubleshooting during incidents, and maintain proper audit trails for compliance requirements. This practice reduces the risk of deploying unintended configurations and improves collaboration among development and operations teams by providing clear context for each configuration version. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appflow-flow-tagged | ID.AM-02.01, ID.AM-05.01 | A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources . Tagging also helps you track accountab le resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authoriza tion strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principal | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | s. You can design these ABAC policies to allow operations when the principal s tag matches the resource tag. For more informati on, see Define permissions based on attributes with ABAC authoriza tion in the IAM User Guide. Dont add personally identifia ble information (PII) or other confidential or sensitive informati on in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the Tagging AWS Resources and Tag Editor User Guide. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-application-tagged | ID.AM-02.01, ID.AM-05.01 | Enforcing this control helps ensure AWS AppIntegrations application resources have tags. Maintaining this configuration reduces security risk for Amazon AppIntegrations resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-description | PR.PS-06.08 | Requiring descriptions for AppIntegrations event integrations enhances operational visibility and maintainability by ensuring each integration is properly documented. Descriptions help teams understand the purpose, scope, and business context of integrations, which is critical for troubleshooting, change management, and knowledge transfer. Well-documented integrations reduce operational risk, improve incident response times, and support compliance requirements that mandate proper documentation of system components and data flows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | ID.AM-02.01, ID.AM-05.01, ID.AM-05.02 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| appmesh-gateway-route-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | DE.CM-01.03, PR.IR-01.02, PR.PS-01.01 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | PR.DS-02.01, PR.PS-01.06 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | PR.PS-04.02, PR.PS-04.03 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | PR.PS-01.01, PR.PS-04.02 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-service-backends-tls-enforced | PR.DS-02.01, PR.PS-01.06 | This control checks that ClientPolicy.Tls.Enforce is set to true for every entry in configuration.Spec.Backends[] on an AWS App Mesh virtual node. When this flag is false for any backend, the Envoy sidecar proxy is permitted to fall back to plaintext communication on that service-to-service path, even if the backend server advertises TLS support. Unlike the companion control APPMESH_VIRTUAL_NODE_BACKEND_DEFAULTS_TLS_ON, which governs the mesh-wide default client policy, this control targets per-backend client policies. A virtual node may have a compliant backend default while individual | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | backend overrides silently disable TLS enforcement for specific service paths. This creates a gap where sensitive east-west traffic, that never leaves the mesh and may therefore be assumed to be encrypted, travels in plaintext between Envoy proxies. The consequence is exposure to on-path interception within the cluster or VPC network, undermining the confidentiality and integrity guarantees that a service mesh is expected to provide. It also breaks the assumption that mutual identity verification via TLS certificates is occurring on those paths, which is a prerequisite for meaningful service- | |

| --- | --- | --- | --- |
| apprunner-service-in-vpc | DE.CM-01.03, DE.CM-01.05, PR.IR-01.01 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | PR.IR-01.01 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| apprunner-service-observability-enabled | DE.AE-02.01, DE.AE-03.01, PR.PS-01.03, PR.PS-04.02, PR.PS-04.03 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| apprunner-service-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging App Runner services enables inventory tracking, ownership attributi on, and classification of deployed web applications and API services. App Runner services are running application workloads serving production traffic. Without tags, organizations cannot identify which team owns each applicati on, what environme nt it runs in (producti on, staging, dev), or what data sensitivity applies to the traffic it handles, making it difficult to enforce access controls, manage costs, and meet compliance requirements for application infrastru cture. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-vpc-connector-tagged | ID.AM-02.01, ID.AM-05.01 | AWS App Runner VPC connectors let App Runner services reach resources inside a VPC by attaching to its subnets and security groups. Enforcing this control helps ensure those AWS App Runner VPC connectors have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes AWS App Runner VPC connectors identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) where authoriza | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for AWS App Runner resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appstream-fleet-in-vpc | PR.IR-01.01 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configuration supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| appsync-associated-with-waf | DE.AE-03.02, DE.CM-01.02, DE.CM-01.03, PR.IR-01.01 | Integrating AppSync with AWS WAF provides protection against common web vulnerabilities like injection, XSS, and unauthorized access, reducing breach risk. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | PR.DS-01.01, PR.PS-01.06 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | PR.DS-02.01, PR.PS-01.06 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | PR.DS-01.01, PR.PS-01.06 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | DE.AE-03.01, DE.AE-03.02, PR.PS-04.02 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | DE.AE-02.01, DE.AE-03.01, DE.AE-03.02, DE.AE-07.02, PR.PS-04.01, PR.PS-04.02, PR.PS-04.03 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aps-rule-groups-namespace-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Amazon Managed Service for Prometheus rule groups namespaces enables inventory tracking and ownership attribution for monitoring and alerting rule definitions. Rule groups namespaces contain alerting rules (that trigger notifications when metric thresholds are breached) and recording rules (that pre-compute metrics). Without tags, organizations cannot identify which team owns each set of monitoring rules, what applications or services they cover, or what environment they apply to, making it difficult to assess monitoring coverage and manage alerting infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-data-catalog-description | PR.PS-06.08 | Requiring descriptions for Athena data catalogs enhances data governance by ensuring proper documentation of catalog purposes, contents, and usage guidelines. Well-documented catalogs improve data discoverability, facilitate compliance with data management policies, and enable teams to understand data sources and their intended use cases. This practice supports organizational data stewardship efforts and reduces the risk of data misuse or confusion in analytics workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-description | PR.PS-06.08 | Requiring descriptions for Athena workgroups enhances operational visibility and governance by ensuring workgroups are properly documented with their intended purpose, usage patterns, and ownership information. Well-documented workgroups improve resource management, facilitate troubleshooting, support compliance auditing, and help teams understand the business context of query workloads. This practice is essential for maintaining organized data analytics environments and ensuring proper resource accountability in multi-team organizations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | PR.DS-01.01, PR.PS-01.06 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | PR.PS-01.01, PR.PS-01.02, PR.PS-01.03 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | PR.PS-02.02, PR.PS-02.03 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| autoscaling-group-elb-healthcheck-required | GV.RM-09.02, PR.IR-03.01, PR.IR-04.02 | Activating ELB health checks for Auto Scaling groups enables the detection of application-level issues that basic EC2 status checks cannot identify. When an instance fails ELB health checks, Auto Scaling can automatically replace it, maintaining application availability and reducing downtime. Without these enhanced health checks, unhealthy instances might continue serving traffic despite application failures, leading to degraded user experience and potential service disruptions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launchconfig-requires-imdsv2 | PR.AA-04.01, PR.PS-01.01 | IMDSv2 is an enhancement to instance metadata access that requires session-oriented requests to add defense in depth against unauthorized metadata access. IMDSv2 requires a PUT request to initiate a session to the instance metadata service and retrieve a token. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| autoscaling-launch-config-hop-limit | PR.DS-01.02, PR.PS-01.01 | Using token hop limits for EC2 prevents attackers from gaining unauthorized access to sensitive resources by chaining together multiple EC2 instances as hops. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| autoscaling-launch-config-public-ip-disabled | PR.IR-01.01, PR.IR-01.02, PR.PS-01.02 | By disabling public IP assignment, the attack surface for EC2 instances launched via ASGs, the attack surface is reduced by prohibiting direct internet access. Instead, place EC2 instances in private VPC subnets and enforce access through the associated load balancer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| autoscaling-launch-template | PR.PS-01.01, PR.PS-01.03 | Using a launch template to create an Auto Scaling group ensures access to the latest features and improvements. | Available in all commercial Regions except Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| autoscaling-multiple-az | PR.IR-03.01, PR.IR-04.02 | Amazon EC2 Auto Scaling group that spans multiple Availability Zones reduces the chances of total outage of instances should an availability zone become unavailable. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-multiple-instance-types | GV.OC-04.03, GV.RM-09.02, PR.IR-03.01, PR.IR-04.02 | Using multiple instance types in an Auto Scaling group enhances availability in your application by allowing EC2 Auto Scaling to launch another instance type if there is insufficient instance capacity in your chosen Availability Zone. Additonally, the use of spot instances can also help reduce operational cost. This ensures availability and resiliency of data and reduces the likelihood of a downtime. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-plan-min-frequency-and-min-retention-check | PR.DS-11.01 | Data loss can occur if recovery points expire before a defined retention period. By configuring the frequency of backup and retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| backup-recovery-point-encrypted | PR.DS-01.01, PR.DS-11.01, PR.PS-01.06 | Encrypt AWS Backup recovery point to protect the backup information. Encrypting the backup recovery point ensures the confidentiality and integrity of the stored backup information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| beanstalk-enhanced-health-reporting-enabled | GV.RM-09.02, PR.IR-03.01 | Enabling health checks in Elastic Beanstalk is crucial for maintaining the reliability and availability of your application. Health checks help ensure that your applicati on's instances are functioning correctly and can automatic ally replace or recover unhealthy instances , improving overall system resilience. By regularly monitorin g the health of your application, you can proactively identify and address issues, minimizin g downtime and providing a smoother user experience. This feature is especiall y important in dynamically scaling environments, where instances can be added or removed based on demand, as it helps maintain a consistent and | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | responsive applicati on environment. | |
| bedrockagentcore-g ateway-authorizer-enabled | PR.AA-02.01, PR.AA-03.01, PR.AA-03.02, PR.PS-01.01 | Configuring authentic ation on Amazon Bedrock AgentCore gateways ensures that only authorize d clients can send requests to your AI agents. Without an authorizer, any entity with network access to the gateway endpoint can invoke your agents, potentially leading to unauthorized data access, resource abuse, or unexpecte d costs. Inbound authorization validates users who attempt to access targets through your AgentCore gateway. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-runtime-private-network-required | DE.CM-01.03, PR.IR-01.01, PR.IR-01.03 | Using public network mode for Amazon Bedrock AgentCore runtimes exposes the runtime directly to the internet, increasing the attack surface and risk of unauthorized access. Configuring runtimes with VPC network mode ensures that runtime traffic is confined within your private network, enabling you to apply network-level security controls such as security groups, network ACLs, and VPC flow logs. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrock-agentcore-memory-encryption-enabled | PR.DS-01.01, PR.PS-01.06 | Amazon Bedrock AgentCore Memory is the persistent memory/context store used by Bedrock generative-AI agents to retain state across sessions. Enforcing this control helps ensure that store is encrypted at rest with a customer-managed AWS KMS key (CMK). This is a detective check: it evaluates AgentCore Memory and reports NON_COMPLIANT when `EncryptionKeyArn` is not configured (i.e., a customer-managed key is not in use). Using a CMK renders stored agent memory unreadable without the key and places key policy and rotation under customer control, reducing the risk of unauthorized access to sensitive context data. Maintaining this | Available only in US East (N. Virginia), US East (Ohio), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | configuration reduces data-at-rest risk for Amazon Bedrock AgentCore resources and supports consistent, auditable compliance. Without it, agent memory may be stored without customer-controlled encryptio n and drift from the intended secure state undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cassandra-keyspace-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Amazon Keyspaces, keyspaces enables inventory tracking, ownership attribution, and data classification for Cassandra database infrastructure. Keyspaces are the top-level namespace grouping related tables that store application data. Without tags, organizations cannot identify which team owns each keyspace, what applications depend on it, or what data sensitivity applies to the tables it contains, making it difficult to enforce appropriate access controls, manage data lifecycle, and meet compliance requirements for database assets. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| clb-multiple-az | PR.IR-01.03, PR.IR-03.01, PR.IR-04.02 | Deploying AWS ELB's across multiple Availability Zones ensures availability of critical functions in the event of an AZ outage, or during regular maintenance, and allows organizat ions to maintain business operations. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cloudformation-sta ck-notification-check | DE.AE-02.02, DE.AE-03.01, DE.AE-06.01, DE.CM-09.03, RS.CO-02.02 | Sending event notifications to an SNS topic allows you to perform real time monitoring of your CloudForm ation stacks and proactively manage the provisioning and update process of AWS resources . CloudFormation stacks event notificat ions help identify unauthorized actions and ensure that AWS resources meet corporate standards and compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Spain), Israel (Tel Aviv), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudformation-stack-service-role-check | PR.AA-05.01, PR.AA-05.03 | Service-managed StackSets use execution roles through AWS Organizations trusted access integration. The control also generates a FAILED finding for an AWS CloudFormation stack created by service-managed StackSets because there is no service role associated with it. Due to how service-managed StackSets authenticate, the roleARN field cannot be populated for these stacks. Using service roles with CloudFormation stacks helps implement least privilege access by separating permissions between the user who creates/updates stacks and the permissions needed by CloudFormation to create/update resources. This reduces the risk of | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | privilege escalation and helps maintain security boundarie s between different operational roles. It is not possible to remove a service role attached to a stack after the stack is created. Other users that have permissions to perform operation s on this stack are able to use this role, regardless of whether those users have the iam:PassRole permission or not. If the role includes permissions that the user shouldnt have, you can unintenti onally escalate a users permissions. Ensure that the role grants least privilege. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudformation-termination-protection-check | PR.PS-01.03 | CloudFormation helps to manage related resources as a single unit called a Stack. You can prevent a stack from being accidentally deleted by enabling termination protection on the stack. If a user attempts to delete a stack with termination protection enabled, the deletion fails and the stack, including its status, remains unchanged. You can set termination protection on a stack with any status except DELETE_IN_PROGRESS or DELETE_COMPLETE. Enabling or disabling termination protection on a stack passes the same choice on to any nested stacks belonging to that stack as well. You cant enable or disable termination protection directly | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | on a nested stack. You cant directly delete a nested stack belonging with a stack that has termination protectio n enabled. If NESTED is displayed next to the stack name, the stack is a nested stack. You can only change termination protection on the root stack to which the nested stack belongs. | |
| cloudfront-accesslogs-enabled | DE.AE-03.01, DE.CM-03.01, PR.PS-04.02, PR.PS-04.03 | Without CloudFront logs, detailed records of requests will not be available to review and investigate any anomalies that may have occurred. Ensuring access logging cannot be disabled will provide assurance that the data cannot be tampered should a security incident occur for further investigation and remediation. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-associated-with-waf | DE.CM-01.03, GV.OC-04.03, PR.IR-01.02, PR.IR-01.03, PR.IR-01.05, PR.IR-04.02 | Configuring AWS WAF web ACL to monitor and block HTTP and HTTPS requests prevent unathorized or malicious attacks on CloudFront distributions minimizing the risk of a security event. It monitors for specific conditions such as IP addresses and query strings to control access to content and prevents malicious attacks on CloudFront distributions. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-custom-ssl-certificate | PR.DS-02.01, PR.PS-01.06 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-default-root-object-configured | DE.CM-01.03, PR.DS-01.01, PR.PS-01.01, PR.PS-01.03 | Without a default root object configured, requests to the root URL of a CloudFront distribution may expose directory listings or other unintended content. Configuring a default root object ensures that users receive a specific file when accessing the distribution's root URL, reducing the risk of information disclosure and maintaining better control over content delivery. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudfront-distribution-key-group-enabled | PR.AA-04.01, PR.AA-05.01 | To use signed URLs or signed cookies, you need a signer. A signer is either a trusted key group that you create in CloudFront, or an AWS account that contains a CloudFront key pair. We recommend that you use trusted key groups because with CloudFront key groups, you dont need to use the AWS account root user to manage the public keys for CloudFront signed URLs and signed cookies. This control does not evaluate multi-tenant CloudFront distributions (connectionMode=tenant-only). | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | PR.PS-01.05, PR.PS-01.06, PR.PS-02.03 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudfront-origin-access-identity-enabled | PR.AA-01.02, PR.AA-03.02 | By requiring authenticated access control to Amazon CloudFront distributions using Amazon S3 origin types, public access to S3 bucket is blocked while still allowing CloudFront to get objects from the bucket. This protects the integrity of the data being served by the CloudFront distribution. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-origin-failover-enabled | PR.IR-03.01, PR.IR-04.02 | CloudFront origin failover increases availability by automatically redirecting traffic to a secondary origin if the primary origin is unavailable or if it returns specific HTTP response status codes. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | PR.AA-04.01, PR.AA-05.01, PR.IR-01.01, PR.PS-01.02 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-s3-origin-access-control-enabled | PR.AA-01.02, PR.AA-03.02 | By requiring authenticated access control to Amazon CloudFront distributions using Amazon S3 origin types, public access to S3 bucket is blocked while still allowing CloudFront to get objects from the bucket. This protects the integrity of the data being served by the CloudFront distribution. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-s3-origin-non-existent-bucket | DE.CM-09.03, PR.PS-01.03 | When an Amazon CloudFront distribution in an account is configured to point to a non-existent bucket, a malicious third party can create the referenced bucket and serve their own content through the distribution. | Available only in US East (N. Virginia), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Israel (Tel Aviv). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-security-policy-check | PR.IR-01.02, PR.IR-01.03 | Enforcing the recommended minimum security policy helps secure CloudFront distributions and protects against potential vulnerabilities or security threats. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-sni-enabled | PR.DS-02.01, PR.PS-01.06 | Using SNI allows CloudFront to associate a domain name with an IP address, and routes each request to the correct edge location, minimizing dropped connections and preventing errors such as "common name mismatch error"and "Your connection is not private. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-traffic-to-origin-encrypted | PR.DS-02.01, PR.PS-01.06 | Encrypting traffic between CloudFron t distribution and its custom origin will ensure that the environme nt is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-viewer-policy-https | PR.DS-02.01, PR.PS-01.06 | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

|---|---|---|---|
| cloud-trail-log-file-validation-enabled | PR.DS-01.01, PR.PS-04.03, RS.AN-07.01 | Enabling log file validation ensures the integrity of CloudTrail log files by digitally signing log files using cryptographic hash functions verifying log data has not been tampered with or modified providing a mechanism to investigate the event, trace its origin, and understand the impact supportin g effective incident response. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cmk-backing-key-rotation-enabled | PR.PS-01.06, PR.PS-01.07 | Rotating KMS keys to reduce the risk of the key being compromised and prevent hackers from gaining access to your data and resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codeartifact-repository-tagged | ID.AM-02.01, ID.AM-05.01 | AWS CodeArtifact repositories store and share software packages (e.g., npm, PyPI, Maven) for an organization's build and deployment pipelines. Enforcing this control helps ensure those AWS CodeArtifact repositories have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes AWS CodeArtifact repositories identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Milan), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | where authoriza tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for AWS CodeArtif act resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-environment-privileged-check | PR.AA-03.02, PR.AA-05.01, PR.PS-01.01, PR.PS-01.02, PR.PS-01.03 | Privileged mode for a CodeBuild environment grants a build project's Docker container access to all devices. Disabling privileged access mode reduces the risk of unauthorized access to all devices, misconfiguration drifts and unintentional disclosure of information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| codebuild-project-envvar-awscred-check | PR.AA-01.01, PR.DS-01.01, PR.PS-06.04 | AWS CodeBuild environment variables can be used in the build commands. To reduce the risk of unauthorized access to sensitive information, ensure that these are not stored in plain text type. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| codebuild-project-logging-enabled | DE.AE-03.01, PR.IR-04.01, PR.PS-04.02 | CodeBuild project build logs show behavior of builds over time. This includes attempted, successful, and failed builds, as well as tracking how long builds run and build resource utilization such as CPU, memory, and storage. These types of logs do not include audit logs. See CloudTrail for audit logs. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-s3-logs-encrypted | PR.DS-01.01, PR.PS-01.06, PR.PS-04.03 | Enforcing encryption on S3 logs generated by AWS CodeBuild projects protects the confidentiality and integrity of data. This control analyzies the settings and policies of the CodeBuild project and S3 bucket to ensure that encryption is enforced for logging. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| codebuild-project-source-repo-url-check | PR.AA-04.01, PR.DS-02.01 | This control helps prevent the inadvertent exposure of sensitive credentials or access tokens in the source repository URL. Additionally, it helps maintain the confidentiality and security of the associated repositories, and ensures that only authorized personnel can access them. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| codebuild-project-tagged | ID.AM-02.01, ID.AM-05.01 | Enforcing this control helps ensure AWS CodeBuild projects have tags. Maintaining this configuration reduces security risk for AWS CodeBuild resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| codebuild-report-group-encrypted-at-rest | PR.DS-01.01, PR.PS-01.06 | Encrypting CodeBuild report groups is crucial for protecting sensitive build and test information. Unencrypted report data could be exposed if storage systems are compromised. Implementing encryption adds an essential layer of security for build and test results. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-auto-rollback-monitor-enabled | PR.IR-03.01, PR.IR-04.02, RC.RP-01.01 | Auto rollback and monitoring helps ensure service continuity by automatically reverting failed deployments, reducing potential downtime and business impact. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-auto-rollback-enabled | GV.OC-04.03, GV.RM-09.02, PR.IR-03.01, PR.IR-04.02 | Auto rollback configuration in CodeDeploy deployment groups provides critical protection against failed deployments by automatically reverting to the previous working version when deployment failures or alarm thresholds are triggered. This capability minimizes application downtime, reduces the impact of problematic deployments, and ensures service availability. Without auto rollback enabled, failed deployments may require manual intervention to restore service, potentially leading to extended outages and degraded user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | PR.PS-02.01, PR.PS-02.02, PR.PS-02.03 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-ec2-minimum-healthy-hosts-configured | PR.IR-03.01, PR.IR-04.02 | Maintaining a minimum number of healthy hosts during deployments is critical for application availability. Without this safeguard, deployments could potentially disrupt all instances simultaneously, causing service outages. Configuring minimum healthy hosts helps maintain service continuity during updates. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-lambda-allatonce-traffic-shift-disabled | PR.PS-06.02, PR.PS-06.07 | Use rolling deployments to control the risks associated with introducing new versions of your Lambda function. In a rolling deployment, the system automatically deploys the new version of the function and gradually sends an increasing amount of traffic to the new version. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codeguruprofiler-profiling-group-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging CodeGuru Profiler profiling groups enables asset inventory tracking, cost allocation, and ownership attribution for application performance profiling resources. Profiling groups collect runtime performance data from applications that may process sensitive workloads, without tags, organizations cannot identify which teams own each profiling group, what environment it operates in, or what data sensitivity level applies, making it difficult to enforce appropriate access controls and meet audit requirements. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codegururevieweer-repository-association-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Amazon CodeGuru Reviewer repository associations enables inventory tracking and ownership attribution for automated code review integrations. Repository associations link source code repositories to the Amazon CodeGuru Reviewer service for automated security and quality analysis. Without tags, organizations cannot identify which team owns each association, what repository it connects to, or what project it supports, making it difficult to manage code review coverage across development teams. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codepipeline-region-fanout-check | GV.RM-09.02, PR.IR-01.03, PR.IR-03.01, PR.IR-04.02 | Deploying applications to multiple regions can improve both latency and availability for your application. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauthenticated-logins | PR.AA-02.01, PR.AA-03.01, PR.AA-04.01, PR.AA-05.01, PR.AA-05.02 | Enforcing this control helps ensure Amazon Cognito identity pools disallow unauthenticated logins. Maintaining this configuration reduces security risk for Amazon Cognito resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | PR.AA-01.02, PR.AA-02.01, PR.AA-03.01, PR.AA-03.02, PR.AA-04.01 | Preventing unauthenticated access to Cognito Identity Pools is critical for maintaining security boundaries and implementing proper access controls. Allowing unauthenticated identities can expose AWS resources to unauthorized users, potentially leading to data breaches, resource abuse, or compliance violations. By monitoring and detecting Identity Pools with unauthenticated access enabled, organizations can ensure that all users are properly authenticated before receiving temporary AWS credentials, supporting defense-in-depth security strategies and regulatory compliance requirements. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-userpool-cust-auth-threat-full-check | PR.AA-02.01, PR.AA-03.01 | Threat protection, formerly called advanced security features, is a set of monitoring tools for unwanted activity in your user pool, and configuration tools to automatically shut down potentially malicious activity. After you create an Amazon Cognito user pool, you can activate threat protection with full function enforcement mode for custom authentication and customize the actions that are taken in response to different risks. Full-function mode includes a set of automatic reactions to detect unwanted activity and compromised passwords. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-advanced-security-enabled | PR.AA-01.01, PR.AA-03.01 | Advanced security features in Cognito user pools are essential for protecting against unauthorized access and potential threats. Without these features, user accounts may be more vulnerable to attacks such as credential stuffing or brute force attempts. Enabling advanced security strengthens overall user authentication and access control. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-deletion-protection-enabled | PR.AA-03.02, PR.AA-05.01, PR.DS-01.01 | Deletion protectio n helps ensure that your user pool is not accidentally deleted. When you configure a user pool with deletion protection, the pool cannot be deleted by any user. Deletion protection prevents you from requesting the deletion of a user pool unless you first modify the pool and deactivate deletion protection. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-mfa-enabled | PR.AA-01.01, PR.AA-02.01, PR.AA-03.01, PR.AA-05.02 | Multi-factor authentication (MFA) adds a something you have authentic ation factor to the something you know factor (typicall y username and password). For federated users, Amazon Cognito delegates authentic ation to the identity provider (IdP) and doesnt offer additional authentic ation factors. However, if you have local users with password authentic ation, configuring MFA for the user pool increases their security. This control is not applicable for federated users and users signing in with passwordless factors. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-password-policy-check | PR.AA-01.01, PR.PS-01.01 | Strong passwords are a security best practice for Amazon Cognito user pools. Weak passwords can expose users credentials to systems that guess passwords and try to access data. This is especially the case for applicati ons that are open to the internet. Password policies are a central element of the security of user directories. By using a password policy, you can configure a user pool to require password complexity and other settings that comply with your security standards and requirements. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |

| --- | --- | --- | --- |
| devicefarm-instance-profile-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Device Farm instance profiles enables proper asset inventory tracking, cost allocation, ownership attributi on, and classific ation. Without tags, instance profiles lack the metadata needed to identify their purpose, owner, or sensitivity level, making it difficult to apply appropria te security policies, manage the asset lifecycle, or meet compliance reporting requirements. | Available only in US West (Oregon). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| devicefarm-project-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Device Farm projects enables inventory tracking and ownership attribution for mobile and web application testing workspace s. Projects organize automated test runs against real physical devices. Without tags, organizations cannot identify which developme nt team owns each testing project, what application it tests, or what environment it belongs to, making it difficult to manage testing infrastructure and allocate costs across development teams. | Available only in US West (Oregon). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| devicefarm-test-grid-project-tagged | ID.AM-02.01, ID.AM-05.01 | AWS Device Farm test grid projects group Selenium-based browser test sessions that run against real desktop browsers in the cloud. Enforcing this control helps ensure those AWS Device Farm test grid projects have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes AWS Device Farm test grid projects identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) where authoriza | Available only in US West (Oregon). Not available in the AWS GovCloud (US) Regions. |

| ec2-instance-multiple-eni-check | PR.PS-01.02 | ENIs facilitate network connectivity on EC2 instances and having more than one ENI allows you to communicate in separate subnets. The number of ENIs attached to EC2 instances should be limited, to prevent unwanted network paths and increased complexity. EC2 instances should only have the minimum number of ENIs, based on their intended purpose. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-no-public-ip | PR.IR-01.01, PR.PS-01.02, PR.PS-01.03 | Restricting the use of Public IP helps reduce the risk of unintentional external network communication with EC2 instances. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| ec2-instance-profile-attached | PR.AA-05.01, PR.AA-05.03, PR.PS-01.01 | Attaching IAM profiles to EC2 instances allows you to manage permissio ns and follow the principle of least privilege to prevent unauthorized access to your resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-ipamscope-tagged | ID.AM-02.01, ID.AM-05.01 | Amazon EC2 IPAM scopes are the top-level container s within AWS IP Address Manager (IPAM) that organize IP address space (public or private) for tracking and allocation. Enforcing this control helps ensure those IPAM scopes have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with aws: are excluded). Consistent tagging makes IPAM scopes identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) where authoriza | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | tion depends on matching resource and principal tags. Because the rule verifies the presence of tag keys and not their values, it evidences that resources are labeled — not that the label content is accurate. Maintaini ng this configura tion reduces security risk for Amazon EC2 resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-last-backup-recovery-point-created | PR.DS-11.01 | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Elastic Compute Cloud (EC2) instances in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ec2-launchtemplate-ebs-encrypted | PR.DS-01.01, PR.PS-01.06 | Enforcing this control helps ensure Amazon EC2 launch template resources have encrypted EBS volumes. Maintaining this configuration reduces security risk for Amazon EC2 resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-templates-ebs-volume-encrypted | PR.DS-01.01, PR.PS-01.06 | Amazon EBS encryption is a straightforward encryption solution for EBS resources that are associated with Amazon EC2 instances. With EBS encryption, you aren't required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes and snapshots. Encryption operations occur on the servers that host EC2 instances, which helps ensure the security of data at rest and data in transit between an EC2 instance and its attached EBS storage. For more information, see Amazon EBS encryption in the Amazon EBS User Guide. You can enable EBS | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | encryption during manual launches of individual EC2 instances. However, there are several benefits to using EC2 launch templates and configuring encryptio n settings in those templates. You can enforce encryptio n as a standard and ensure the use of consistent encryptio n settings. You can also reduce the risk of error and security gaps that might occur with manual launches of instances. When this control checks an EC2 launch template, it only evaluates EBS encryption settings that are explicitly specified by the template. The evaluation doesn't include encryptio n settings that are inherited from account-level EBS encryption settings, AMI block device mappings, or source | |

| | | snapshot encryption statuses. | |
| ec2-launch-template-imdsv2-check | PR.AA-04.01, PR.PS-01.01 | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-launch-template-public-ip-disabled | PR.IR-01.02, PR.PS-01.01 | Assigning public IPs via Amazon EC2 launch template makes any Amazon EC2 instances utilizing that template public and can possibly lead to unintended access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-tagged | ID.AM-02.01, ID.AM-05.01 | A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environment, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notifications. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authorization in the IAM User Guide. For more information about tags, see the Tagging AWS Resources and | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
