| ec2-traffic-mirror-session-description | PR.PS-06.08 | Requiring descriptions for EC2 traffic mirror sessions enhances operational visibility security management by ensuring each session is properly documented with its intended purpose, scope, configuration details. This documentation is critical for security auditing, troubleshooting network issues, compliance reporting, maintaining an organized traffic monitoring infrastructure. Well-documented mirror sessions help security teams quickly identify the purpose of network monitoring activities ensure that traffic mirroring is being used appropriately within the environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-traffic-mirror-session-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging EC2 traffic mirror sessions enables inventory tracking, ownership attribution, and classification of network monitoring infrastructure. Traffic mirror sessions copy network packets from source ENIs to security inspectio n targets (IDS/IPS, packet capture systems). Without tags, organizations cannot identify which team owns each mirroring session, what application traffic is being captured, or what data sensitivity applies to the mirrored traffic, making it difficult to verify monitoring coverage and meet audit requirements for network security infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Milan), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| ec2-traffic-mirror-target-tagged | ID.AM-02.01, ID.AM-05.01 | A tag is a label that you create and assign to an AWS resource. Each tag consists of a required tag key and an optional tag value. You can use tags to categorize resources by purpose, owner, environme nt, or other criteria. They can help you identify, organize, search for, and filter resources. They can also help you track resource owners for actions and notificat ions. You can also use tags to implement attribute-based access control (ABAC) as an authorization strategy. For more information about ABAC strategies, see Define permissions based on attributes with ABAC authoriza tion in the IAM User Guide. For more information about tags, see the Tagging AWS Resources and | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | ID.RA-01.03, PR.PS-02.01, PR.PS-02.02 | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabilities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-lifecycle-policy-configured | ID.AM-08.01, PR.IR-04.02, PR.PS-01.01, PR.PS-01.03 | Amazon ECR lifecycle policies provide more control over the lifecycle managemen t of images in a private repositor y to automate the cleaning up of your container images by expiring images based on age or count and maintain a strong security posture. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ecr-private-tag-im mutability-enabled | DE.CM-09.03, ID.AM-02.01, PR.PS-01.01 | Immutable tags are static and refer to a unique image. This improves reliabili ty and scalability, prevents the tags from being overridde n, and reduces the attack surface. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-cmk-encryption-enabled | PR.DS-01.01, PR.PS-01.06 | Amazon ECR repositories store container images, which frequently embed application code, dependencies, and configuration. Enforcing this control helps ensure each repository is encrypted at rest with a customer-managed AWS KMS key (CMK) rather than AES256 or the AWS-managed default key ('aws/ecr'). This is a detective check: it evaluates each repository and reports NON_COMPLIANT when a CMK is not in use. A CMK renders stored image data unreadable without the key and places key policy, grants, and rotation under customer control. Because the rule confirms a CMK is associated, not how keys are generated, rotated, or | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | revoked. It evidences that encryption at rest is enabled, not that a key-lifecycle management program exists. Maintaining this configuration reduces data-at-rest risk for Amazon ECR resources and supports consistent, auditable compliance. Without it, repository contents may fall back to default encryption outside the organization's key governance and drift from the intended secure state undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01, ID.AM-07.01 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | PR.IR-01.01, PR.PS-01.01 | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | ecs-task-definition-linux-user-non-root | PR.AA-03.02, PR.AA-05.01, PR.AA-05.02, PR.PS-01.01 | When Linux containers run with root privileges, they pose several significant security risks. Root users have unrestricted access within the container. This elevated access increases the risk of container escape attacks, where an attacker could potentially break out of container isolation and access the underlying host system. If a container running as root is compromised, attackers may exploit this to access or modify host system resources, affecting other containers or the host itself. Furthermore, root access could enable privilege escalation attacks, allowing attackers to gain additional permissions beyond the containers intended | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | scope. The user parameter in ECS task definitions can specify users in several formats, including username, user ID, username with group, or UID with group ID. Its important to be aware of these various formats when configuring task definitions to ensure no root access is inadvertently granted. Following the principle of least privilege, containers should run with the minimum required permissions using non-root users. This approach significa ntly reduces the potential attack surface and mitigates the impact of potential security breaches. This control only evaluates the container definitio ns in a task definitio n if the operating SystemFamily | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | is configured as LINUX or operating SystemFamily is not configured in the task definition. The control will generate a FAILED finding for an evaluated task definition if any container definition in the task definitio n has user not configured or user configured as default root user. The default root users for LINUX containers are "root" and "0". | |
| ecs-task-definition-log-configuration | PR.PS-04.02, PR.PS-04.03 | Collecting data from task definitions provides visibility, which can enable processes debugging and identification of the root cause of errors. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| eks-endpoint-no-public-access | PR.AA-03.02, PR.IR-01.01, PR.IR-01.05 | Restricting public access reduces risk exposure and unintentional access to EKS endpoints. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| eks-fargate-profile-tagged | ID.AM-02.01, ID.AM-05.01 | Enforcing this control helps ensure Amazon EKS fargate profiles have tags. Maintaining this configuration reduces security risk for Amazon Elastic Kubernetes Service resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | PR.DS-11.01, PR.IR-03.01 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-auto-minor-version-upgrade-check | ID.RA-01.03, PR.PS-02.01 | Enabling automatic minor version upgrades for Amazon ElastiCache ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Melbourne), Canada West (Calgary), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-rbac-auth-enabled | PR.AA-02.01, PR.AA-05.01 | RBAC authentication provides fine-grained access control for Redis clusters. Without RBAC, managing access to cache resources could be less secure and more difficult to maintain. Implementing RBAC ensures proper authentication and authorization for cache access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-redis-cluster-automatic-backup-check | PR.DS-11.01 | Enabling backups ensures that data is protected against accidental deletion, data corruption, and in the case of a system failure, you can restore your cluster from a backup, minimizin g downtime and ensuring business continuity. Point-in-time backups can restore your cluster to a specific point in time. Backups can be used for testing and development purposes, where a copy of the productio n cluster can be replicated for testing new features, debugging, or other development activitie s without impacting the live environment. | Available in all commercial Regions except Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| elasticache-repl-grp-auto-failover-enabled | PR.IR-03.01, PR.IR-04.02, RC.RP-01.01 | When automatic failover is enabled for a replication group, the role of primary node will automatic ally fail over to one of the read replicas. This failover and replica promotion allow writing to the new primary after promotion is complete. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-at-rest | PR.DS-01.01, PR.PS-01.06 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-in-transit | PR.DS-02.01, PR.PS-01.06 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic, and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-redis-auth-enabled | PR.AA-03.01 | When utilizing Redis authentication tokens, or passwords , Redis requires a password before allowing clients to run commands, which improves data security. RBAC is not available for Redis versions earlier than 6.0. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-subnet-group-check | PR.IR-01.01, PR.PS-01.01 | When launching an Amazon ElastiCac he cluster, a default subnet group is created if one doesn't exist already. The default group uses subnets from the default Virtual Private Cloud (VPC). Using custom subnet groups is more restrictive of the subnets that the cluster resides in, and the networking that the cluster inherits from the subnets. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-description | PR.PS-06.08 | Application descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand application purposes, enables effective resource governance, assists in troubleshooting and maintenance activities, and ensures accountability in multi-team environments. Well-documented applications also support audit processes and help maintain organizational knowledge as team members change over time. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-version-description | PR.PS-06.08 | Application version descriptions provide essential documentation for tracking changes, understanding deployment history, and maintaining operational visibility. Proper documentation enables teams to quickly identify the purpose and contents of specific application versions, facilitates troubleshooting and rollback procedures, and supports compliance requirements for change management. Without descriptions, organizations lose critical context about application deployments, making it difficult to manage the application lifecycle effectively and increasing the risk of deploying incorrect or outdated versions. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-environment-description | PR.PS-06.08 | Environment descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand the purpose and context of each environment, reduces troubleshooting time, and ensures accountability in multi-team environments. This practice is particularly important for maintaining clear separation between development, staging, and production environments while supporting audit trails and change management processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| elasticsearch-encrypted-at-rest | PR.DS-01.01, PR.PS-01.06 | Configuring encryption at rest for OpenSearch is crucial to ensure the security and confidentiality of your data. By encrypting data at rest, you protect it from unauthorized access and potential breaches, mitigating the risk of data exposure. This essential security measure helps maintain compliance with industry standards and regulations, building trust with users and safeguarding your organization's reputation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-in-vpc-only | PR.IR-01.01 | Placing OpenSearch domains in a VPC provides network isolation by separating them from the public internet to protect them from unauthorized access and prevent potential security threats through network access control lists (ACLs), and security groups defense in-depth security. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-logs-to-cloudwatch | DE.AE-03.02, PR.PS-04.02, PR.PS-04.03 | Sending OpenSearch logs to CloudWatch can provide a centralized and unified platform for log management, analysis, and monitoring. These logs can provide real-time insights into the OpenSearch environment, detect issues promptly, and optimize its performance, ultimately leading to better operational efficiency and a more responsive user experience. Additionally, CloudWatch's integration with other AWS services enables seamless coordination and holistic visibility across your entire cloud infrastructure. NOTE - To send audit logs to cloudwatch logs requires a two-step process. First enable the audit logs for the domain and | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | second turn on audit logs in OpenSearch dashboards. | |
| elasticsearch-node-to-node-encryption-check | PR.DS-02.01, PR.IR-01.05, PR.PS-01.06 | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | DE.AE-03.01, PR.PS-04.02, PR.PS-04.03, RS.MA-02.01 | Amazon CloudWatch logs provides a centralized, scalable, solution for log management, monitoring, troubleshooting and integration, with fine grained access controls that will meet security and regulation requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elastic-beanstalk-managed-updates-enabled | PR.PS-02.01 | Automatically applying managed patches in Elastic Beanstalk ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-acm-certificate-required | PR.DS-02.01, PR.PS-01.06, PR.PS-01.07 | SSL certificates provided by AWS Certificate Manager (ACM) on Load balancers facilitate the management of certificates, keep data secure and prevent data in transit from Man in the Middle attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | PR.DS-02.01, PR.PS-01.06 | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-multiple-az | PR.IR-01.03, PR.IR-03.01, PR.IR-04.02 | By distributing traffic to registere d instances in multiple availabil ity zones (AZs) the ELB provides high availability, automatic scaling, and robust security that improves fault-tolerance for cloud resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-targetgroup-healthcheck-protocol-encrypted | PR.DS-02.01, PR.PS-01.06 | Load Balancers send health check requests to registered targets to determine their status and route traffic accordingly. The health check protocol specified in the target group configuration determines how these checks are performed. When health check protocols use unencrypted communication such as HTTP, the requests and responses can be intercepted or manipulated during transmission. This allows attackers to gain insights into infrastructure configuration, tamper with health check results, or conduct man-in-the-middle attacks that affect routing decisions. Using HTTPS for health checks provides encrypted | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | communication between the load balancer and its targets, protectin g the integrity and confidentiality of health status information. | |
| elbv2-targetgroup-protocol-encrypted | PR.DS-02.01, PR.PS-01.06 | Encrypting data in transit protects it from interception by unauthorized users. Target groups that use unencrypted protocols (HTTP, TCP, UDP) transmit data without encryption, making it vulnerabl e to eavesdropping. Using encrypted protocols (HTTPS, TLS, QUIC) ensures that data transmitt ed between load balancers and targets is protected. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-acm-certificate-required | PR.DS-02.01, PR.PS-01.06, PR.PS-01.07 | Encrypt data in transit to maintain the confidentiality and integrity of data as it traverses public and unsecured networks and reduce the risk of unauthori zed access to data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |
| elb-cross-zone-load-balancing-enabled | PR.IR-01.03, PR.IR-03.01, PR.IR-04.02 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-deletion-protection-enabled | DE.CM-09.03, PR.IR-03.01 | With the deletion protection safety feature enabled, you have the guarantee that your AWS application load balancers cannot be accidentally deleted and ensure that your load-balanced environments remain safe. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | PR.IR-01.01 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-logging-enabled | DE.CM-03.01, PR.PS-04.02, PR.PS-04.03 | Access logs are disabled by default for your Application Load Balancer (ALB), Classic Load Balancer (CLB) and Network Load Balancer (NLB). By enabling access logs, you can obtain detailed records of HTTP/HTTPS requests made to your Load Balancer which can help analyze traffic patterns, implement protective plans and identify and troubleshoot security issues in a timely manner. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | PR.DS-02.01, PR.PS-01.06 | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-block-public-access | PR.IR-01.01, PR.IR-01.02, PR.PS-01.02 | Preventing Amazon Elastic MapReduce (EMR) from launching a cluster in a public subnet protects data from unauthorized access. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-kerberos-enabled | PR.AA-02.01, PR.AA-03.01, PR.AA-04.01, PR.DS-02.01, PR.PS-01.01, PR.PS-01.03, PR.PS-01.06 | Using Kerberos for authentication with Amazon EMR provides user convenience, centralized management, integration with existing infrastructure, compatibility with the Hadoop ecosystem, and enhanced security while protecting sensitive data preventing unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-master-no-public-ip | DE.CM-01.03, PR.AA-03.02, PR.IR-01.01, PR.PS-01.01 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | PR.DS-01.01, PR.PS-01.06 | Encryption at rest for Amazon EMR clusters protects sensitive data stored on cluster instances from unauthorized access. This control helps ensure compliance with data protection regulations and security best practices by detecting EMR configurations that lack proper encryption settings. Monitoring encryption configuration helps prevent data exposure risks and maintains data confidentiality for big data processing workloads. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | PR.DS-02.01, PR.PS-01.06 | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). | frauddetector-entity-type-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of Fraud Detector entity types is essential for maintaining operational visibilit y and control. Tags facilitate effective resource managemen t, cost tracking, and access control implementation. Without structured tagging, organizat ions risk losing oversight of their fraud detection infrastructure and associated resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| frauddetector-label-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Fraud Detector labels is crucial for maintaining clear visibility and control over fraud detection configurations. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and analyze their fraud detection labels. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-outcome-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Fraud Detector outcomes is essential for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their fraud detection outcomes and associated analysis capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-variable-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of Fraud Detector variables is crucial for maintaining clear visibility and control over fraud detection configurations. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may face challenges in managing and analyzing their fraud detection variables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | PR.DS-11.01, PR.IR-03.01, PR.PS-01.01 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| fsx-lustre-copy-tags-to-backups | ID.AM-02.01 | Ensure resource tags are copied to Amazon FSx backups to retain all associated metadata, which aids in recovery efforts and allows for proper identification. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-openzfs-copy-tags-enabled | ID.AM-02.01, ID.AM-07.01 | Identification and inventory of IT assets is a crucial aspect of governance and security. Using tags provides enhanced visibility of FSx backups and volumes so that their security posture can be assessed and action can be taken on potential areas of weakness. | Available in all commercial Regions except Asia Pacific (Melbourne). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-resources-protected-by-backup-plan | PR.DS-11.01, PR.IR-03.01 | Failure to backup Amazon FSx file systems can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | DE.AE-03.01, DE.CM-03.01, PR.PS-04.02, RS.AN-07.01 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| global-endpoint-event-replication-enabled | PR.IR-01.03, PR.IR-03.01 | Event replication is required to automatically recover from a failover event. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-ml-transform-encrypted-at-rest | PR.DS-01.01, PR.PS-01.06 | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| glue-ml-transform-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging AWS Glue ML transforms enables proper asset inventory tracking, cost allocation, ownership attributi on, and data classific ation. ML transform s process potential ly sensitive data; without tags, organizations lack the metadata needed to identify transform ownership , data sensitivity, environment context, or compliance scope, making it difficult to apply appropriate access controls and meet audit requireme nts." | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| groundstation-conf ig-tagged | ID.AM-02.01, ID.AM-05.01 | AWS Ground Station config resources define reusable parameter sets (such as antenna downlink/ uplink and tracking settings) reference d when schedulin g satellite contacts. Enforcing this control helps ensure those config resources have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consisten t tagging makes config resources identifiable in an automated asset inventory, supports ownership accountab ility and cost allocatio n, and enables attribute-based access control (ABAC) | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Europe (Frankfur t), Europe (Ireland) , Europe (Stockhol m), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | where authoriza tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for AWS Ground Station resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |
| groundstation-data flowendpointgroup-tagged | ID.AM-02.01, ID.AM-05.01 | Enforcing this control helps ensure AWS GroundStation dataflow endpoint group resources have tags. Maintaining this configuration reduces security risk for AWS Ground Station resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Europe (Frankfur t), Europe (Ireland) , Europe (Stockhol m), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| groundstation-missionprofile-tagged | ID.AM-02.01, ID.AM-05.01 | AWS Ground Station mission profiles define the configuration used to schedule and execute satellite contacts, grouping the parameters applied during a contact. Enforcing this control helps ensure those mission profile resources have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes mission profile resources identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Europe (Frankfurt), Europe (Ireland), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | where authoriza tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for AWS GroundSta tion mission profile resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | DE.AE-02.01, DE.AE-03.01, DE.AE-03.02, DE.AE-07.01, DE.CM-01.01, DE.CM-03.02 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | DE.AE-02.01, DE.AE-03.01, DE.AE-03.02, DE.AE-07.02, DE.CM-01.01, DE.CM-01.03, DE.CM-03.01, DE.CM-03.02, DE.CM-03.03, PR.PS-04.02, PR.PS-04.03, RS.AN-07.01, RS.MA-02.01 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon ECS clusters on AWS Fargate. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-audit-enabled | DE.AE-02.01, DE.AE-03.01, DE.AE-03.02, DE.AE-07.02, DE.CM-03.01, DE.CM-03.02, DE.CM-03.03, PR.PS-04.02, PR.PS-04.03, RS.AN-07.01 | GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious or malicious activity in your Amazon EKS clusters, such as unauthorized API calls, privilege escalation, and configuration tampering. Enabling it provides continuous threat detection for the container control plane so that compromises can be identified and investigated quickly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | DE.AE-02.01, DE.AE-03.01, DE.AE-03.02, DE.AE-07.02, DE.CM-01.01, PR.PS-04.02, PR.PS-04.03, RS.AN-07.01, RS.MA-02.01 | EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-enabled-centralized | DE.CM-01.01, DE.CM-01.02, DE.CM-01.03 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| guardduty-lambda-protection-enabled | DE.AE-02.01, DE.AE-03.01, DE.CM-01.01, DE.CM-01.03, DE.CM-02.01 | Lambda Protection is crucial for maintaining security visibility in serverless architectures. Without this feature, organizations may miss potential security threats targeting their Lambda functions. Enabling Lambda Protection provides enhanced security monitoring for serverless workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | DE.AE-02.01, DE.AE-03.02, DE.AE-07.02, GV.OC-04.03, GV.RM-09.02, PR.DS-01.01, PR.DS-01.02, PR.PS-04.02, PR.PS-04.03, PR.PS-05.01, RS.AN-07.01, RS.MA-02.01 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administr ator can enable or disable the Malware Protection feature for the member accounts in the organizat ion. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Malware Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-non-archived-findings | ID.RA-01.03, PR.PS-02.01 | Resolving GuardDuty findings is essential to maintaining a secure and resilient cloud environment. By addressing these findings, you proactively mitigate potential security risks and vulnerabilities, safeguarding sensitive data and infrastructure from unauthorized access and malicious activities. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| guardduty-rds-protection-enabled | DE.AE-02.01, DE.AE-03.01, DE.CM-01.01, DE.CM-02.01, DE.CM-03.01, DE.CM-03.02 | RDS Protection is crucial for maintaining database security and detecting potential threats. Without this feature, organizations may miss security incidents targeting their database instances. Enabling RDS Protection provides enhanced security monitoring for database environments. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | DE.AE-02.01, DE.AE-03.01, DE.CM-01.01, RS.MA-02.01 | In a multi-account environment, only the delegated GuardDuty administrator can enable or disable GuardDuty Runtime Monitoring for accounts in their organization. In addition, only the GuardDuty administrator can configure and manage the security agents that GuardDuty uses for runtime monitoring of AWS workloads and resources for accounts in the organization. GuardDuty member accounts cant enable, configure, or disable Runtime Monitoring for their own accounts. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | DE.AE-02.01, DE.AE-03.01, DE.AE-03.02, DE.AE-07.01, DE.CM-02.01, RS.MA-02.01 | Amazon GuardDuty S3 Protection analyzes S3 data-plane events (such as GetObject, PutObject, and DeleteObject) to detect potentially malicious or anomalous access to your S3 data, including credential misuse and data exfiltration. Enabling S3 Protection extends GuardDuty threat detection to your object storage so suspicious activity against sensitive data can be identified and investigated promptly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| healthlake-fhirdatastore-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging HealthLake FHIR Datastores enables inventory tracking, ownership attribution, and data classification for healthcare data repositories. FHIR Datastores contain Protected Health Information (PHI) subject to HIPAA and other healthcare regulations. Without tags, organizations cannot identify which team owns each datastore, what patient populations or clinical applications it serves, what data sensitivity applies (PHI vs. de-identified), or what regulatory obligations govern it, making it difficult to enforce appropriate access controls and demonstrate compliance with healthcare data protection requirements." | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), and Asia Pacific (Mumbai). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-external-access-analyzer-enabled | PR.AA-01.02, PR.AA-05.01, PR.AA-05.04 | External access analysis is crucial for maintaining security control over AWS resources. Without Access Analyzer, organizations may have difficulty identifying unintended external access to their resources. Implementing external access analysis helps prevent unauthorized resource exposure. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-group-has-users-check | PR.AA-05.01 | AWS IAM user groups that do not contain any users adds unnecessary operational complexity, increases oversight and could lead to unintentional risk. Ensuring that all user groups have user accounts simplifies management and oversight and reduces risk. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-no-inline-policy-check | PR.PS-01.01 | Restrict IAM user, role and group from using inline policies. While this can be convenient, using inline policies can lead to non-compliant issues and increase operational/security risks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | PR.AA-01.01, PR.AA-02.01, PR.AA-03.01, PR.AA-05.02 | Attackers can launch a brute force attack and retrieve weak passwords if they do not meet specified requirements. Ensure to setup and enforce strong password configura tion requirements to mitigate the risk of password guessing, brute force or dictionary attacks, which could lead to unauthorized access to sensitive data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | PR.AA-03.02, PR.AA-05.01, PR.PS-01.01 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-description | PR.PS-06.08 | Enforcing this control helps ensure AWS Identity and Access Management (IAM) Policy description field exists. Maintaining this configuration reduces security risk for AWS Identity and Access Management resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | PR.AA-05.01, PR.PS-01.01 | To ensure the confidentiality, integrity and availability of AWS resources from accidental or malicious activity, IAM policies containing full administrative privileges must not be permitted. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iam-policy-no-statements-with-full-access | PR.AA-03.02, PR.AA-05.01, PR.PS-01.01 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | PR.AA-03.02, PR.AA-05.01, PR.AA-05.02 | Root user should not routinely access the AWS account. The access key for your AWS account root user gives full access to all your resources for all AWS services, including your billing informati on. You can't reduce the permissions associated with your AWS account root user access key. This helps to minimize potential unwanted or even unauthori zed changes to the environment, which could result in a negative impact to the business. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | PR.PS-01.07 | Certificate expiration monitoring is essential for maintaining secure communications. Expired certificates can lead to service disruptions and security vulnerabilities. Regular monitoring helps prevent certificate-related outages and security issues. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | ID.AM-02.01, PR.PS-01.07 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-group-membership-check | PR.AA-01.01, PR.AA-05.01 | Associating IAM users to IAM groups is a security best practice that supports the principle of least privilege. It simplifies the process of managing permissions, and reduces complexity and human errors. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-mfa-enabled | PR.AA-02.01, PR.AA-03.01, PR.AA-05.02 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | PR.AA-03.02, PR.AA-05.01 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | PR.AA-01.01, PR.AA-05.03 | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| imagebuilder-distributionconfiguration-tagged | ID.AM-02.01, ID.AM-05.01 | Requiring tags on EC2 Image Builder resources provides the metadata foundation for resource attribution, discovery, and inventory tracking. Enforcing this control helps ensure ImageBuilder DistributionConfiguration resources have tags. Maintaining this configuration reduces security risk for EC2 Image Builder resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| imagebuilder-image pipeline-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging EC2 Image Builder image pipelines enables inventory tracking, ownership attributi on, and classification of automated image build infrastructure. Image pipelines orchestrate the creation, testing, and distribution of AMIs and container images used across the organization. Without tags, organizations cannot identify which team owns each pipeline, what application images it produces, or what environment and sensitivity level applies to its outputs, making it difficult to manage the image supply chain and ensure golden images are governed appropriately. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| imagebuilder-image recipe-ebs-volumes-encrypted | PR.DS-01.01, PR.PS-01.06 | Enforcing this control helps ensure all Amazon EBS volumes in EC2 Image Builder image recipe block device mappings have encryption enabled. Maintaining this configuration reduces security risk for EC2 Image Builder resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| imagebuilder-image recipe-tagged | ID.AM-02.01, ID.AM-05.01 | EC2 Image Builder image recipes define the source image and the component s used to build and configure customized machine images. Enforcing this control helps ensure those image recipe resources have tags. This is a detective check: it evaluates each image recipe and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with aws: are excluded). Consistent tagging makes image recipes identifiable in an automated asset inventory, supports ownership accountab ility and cost allocatio n, and enables attribute-based access control (ABAC) where authoriza tion depends on | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | matching resource and principal tags. Maintaining this configuration reduces security risk for EC2 Image Builder resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| imagebuilder-infrastructureconfiguration-tagged | ID.AM-02.01, ID.AM-05.01 | EC2 Image Builder infrastructure configuration resources define the compute environment (instance type, subnet, IAM instance profile, logging) used to build and test images. Enforcing this control helps ensure those infrastructure configuration resources have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing. Consistent tagging makes EC2 Image Builder infrastructure configuration resources identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | access control (ABAC) where authoriza tion depends on matching resource and principal tags. Without it, resources may drift from the intended secure state and go undetected. | |
| restricted-ssh | PR.AA-03.02, PR.IR-01.01, PR.IR-01.02, PR.IR-01.05, PR.PS-01.01, PR.PS-01.03 | It is recommend ed that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | ID.RA-01.03, PR.PS-02.02 | EC2 security scanning is crucial for maintaining strong security posture of compute resources . Without regular scanning, organizat ions may be unaware of vulnerabilities in their EC2 instances . Implementing automated scanning helps identify and address security weaknesses. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Canada West (Calgary) , Europe (Spain), Mexico (Central) , and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-ecr-scan-enabled | ID.RA-01.03, PR.PS-02.02 | Container image scanning is essential for maintaining security in container ized environments. Without regular scanning, organizat ions may deploy containers with known vulnerabi lities. Implement ing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Canada West (Calgary) , Europe (Spain), Mexico (Central) , and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-code-scan-enabled | ID.RA-01.03, PR.PS-02.02 | Amazon Inspector Lambda code scanning scans the custom application code within an AWS Lambda function for code vulnerabilities based on AWS security best practices. Lambda code scanning can detect injection flaws, data leaks, weak cryptography, or missing encryption in your code. This feature is available in specific AWS Regions only. You can activate Lambda code scanning together with Lambda standard scanning (see Inspector.4 Amazon Inspector Lambda standard scanning should be enabled). | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | ID.RA-01.03, PR.PS-02.02 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| internet-gateway-authorized-vpc-only | PR.IR-01.01, PR.PS-01.01, PR.PS-01.02, PR.PS-01.03 | This control provides a mechanism that forces attention on which VPC(s) should be allowed to access the public internet. This control will require the appropriate VPC(s) to be identified and labeled as approved for internet accesses through use of an IGW. Failure to identify and validate the list of authorized VPC's could cause unintended access to AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotevents-alarm-model-tagged | ID.AM-02.01, ID.AM-05.01 | AWS IoT Events alarm models define threshold-based alarms that monitor a property and change state when the value breaches configured limits. Enforcing this control helps ensure those AWS IoT Events alarm models have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes AWS IoT Events alarm models identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) where authoriza | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | access control (ABAC) where authoriza tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for AWS IoT Events resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotevents-input-tagged | ID.AM-02.01, ID.AM-05.01 | AWS IoT Events inputs define the schema for telemetry data that detector and alarm models ingest and evaluate. Enforcing this control helps ensure those AWS IoT Events inputs have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes AWS IoT Events inputs identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) where authorization depends on matching resource | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | and principal tags. Maintaining this configuration reduces security risk for AWS IoT Events inputs and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |
| iotsitewise-asset-model-tagged | GV.OC-04.01, ID.AM-01.01, ID.AM-02.01, ID.AM-07.01 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-dashboard-tagged | GV.OC-04.01, ID.AM-01.01, ID.AM-02.01, ID.AM-05.01, ID.AM-05.02, ID.AM-07.01, PR.PS-06.08 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-gateway-tagged | ID.AM-01.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | ID.AM-01.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | ID.AM-01.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industrial IoT initiatives. Without proper tagging, organizations may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| iottwinmaker-scene-tagged | ID.AM-01.01, ID.AM-02.01, ID.AM-05.01 | A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources . Tagging also helps you track accountab le resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authoriza tion strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principal | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | s. You can design these ABAC policies to allow operations when the principal s tag matches the resource tag. For more informati on, see Define permissions based on attributes with ABAC authoriza tion in the IAM User Guide. Dont add personally identifia ble information (PII) or other confidential or sensitive informati on in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the Tagging AWS Resources and Tag Editor User Guide. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iottwinmaker-sync-job-tagged | ID.AM-02.01, ID.AM-05.01 | AWS IoT TwinMaker sync jobs synchronize resources (e.g., from AWS IoT SiteWise) into a TwinMaker workspace's knowledge graph for digital-twin modeling. Enforcing this control helps ensure those AWS IoT TwinMaker sync jobs have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes AWS IoT TwinMaker sync jobs identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | where authoriza tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for AWS IoT TwinMaker sync jobs and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| --- | --- | --- | --- |
| iottwinmaker-workspace-tagged | ID.AM-01.01, ID.AM-02.01, ID.AM-05.01 | Tagging IoT TwinMaker workspaces enables inventory tracking, ownership attribution, and classification of digital twin infrastructure. Workspaces contain digital representations of physical systems (factories, buildings, industrial plants) connected to real-world sensors and cameras. Without tags, organizations cannot identify which facility or team owns each workspace, what physical assets it represents, or what criticality level applies to the industrial systems being monitored, making it difficult to manage IoT/OT security and meet compliance requirements. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iotwireless-fuota-task-tagged | ID.AM-02.01, ID.AM-05.01 | Requiring tags on AWS IoT Wireless FUOTA tasks helps identify and organize tasks by owner, purpose, or environment. When specific tag keys are required, the check also supports consisten t asset labeling and accountability. It verifies tag presence, but does not validate tag values or enforce access permissions. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotwireless-multicast-group-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of AWS IoT Wireless multicast groups is crucial for maintaining operational control and visibility of industrial multicast groups. Without proper tagging, organizations may face challenges in managing their IoT network resources. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotwireless-service-profile-tagged | ID.AM-02.01, ID.AM-05.01 | AWS IoT Wireless service profiles define the LoRaWAN network settings applied to associate d wireless devices. Enforcing this control helps ensure those IoT Wireless service profiles have tags. Maintaining this configuration reduces security risk for AWS IoT Wireless resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | PR.AA-02.01, PR.AA-03.01, PR.AA-04.01 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). | | | access control (ABAC) where authoriza tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for AWS IoT (Device Defender) scheduled audits and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | PR.AA-03.02 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| ivs-channel-tagged | ID.AM-02.01, ID.AM-05.01 | A tag is a label that you assign to an AWS resource, and it consists of a key and an optional value. You can create tags to categorize resources by purpose, owner, environment, or other criteria. Tags can help you identify, organize, search for, and filter resources . Tagging also helps you track accountab le resource owners for actions and notifications. When you use tagging, you can implement attribute-based access control (ABAC) as an authoriza tion strategy, which defines permissions based on tags. You can attach tags to IAM entities (users or roles) and to AWS resources. You can create a single ABAC policy or a separate set of policies for your IAM principal | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | s. You can design these ABAC policies to allow operations when the principal s tag matches the resource tag. For more informati on, see Define permissions based on attributes with ABAC authoriza tion in the IAM User Guide. Dont add personally identifia ble information (PII) or other confidential or sensitive informati on in tags. Tags are accessible to many AWS services, including AWS Billing. For more tagging best practices, see Best practices and strategies in the Tagging AWS Resources and Tag Editor User Guide. | |

| | | tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for Amazon Kinesis Video Streams resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |
| kinesis-firehose-delivery-stream-encrypted | PR.DS-01.01, PR.PS-01.06 | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| kinesis-stream-backup-retention-check | PR.PS-04.01, PR.PS-04.03 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-encrypted | PR.DS-01.01, PR.PS-01.06 | Ensuring encryption is enabled for Kinesis data streams at rest reduces the likelihood of unintentional data exposure and reduces the risk of a data breach. Server side encryption is available in Kineses to perform this function. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-cmk-not-scheduled-for-deletion | PR.DS-01.02, PR.PS-01.07 | KMS keys cannot be recovered if deleted and any data which has been encrypted by that KMS key will be unrecoverable leading to business loss of data. If meaningful data has been encrypted under a KMS key scheduled for deletion, consider decrypting the data or re-encrypting the data under a new KMS key unless you are intentionally performing a cryptographic erasure. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | PR.AA-01.02, PR.AA-03.02, PR.AA-05.01, PR.PS-01.07 | A publicly accessible AWS KMS key policy allows principal s outside your organization to use the key for cryptographic operations, which can lead to unauthori zed decryption of protected data or unsanctioned encryption. Restricti ng the key policy to specific trusted principals enforces least privilege and protects the confidentiality of data encrypted with the key. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-concurrency-check | GV.OC-04.03, GV.RM-09.02, PR.IR-03.01, PR.IR-04.02 | Enable thresholds for concurrent execution limits to limit traffic to downstream resources called by Lambda to prevent throttling of critical functions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| lambda-dlq-check | DE.AE-07.02, PR.IR-03.01, RS.MA-02.01 | AWS Lambda functions cannot trace retries and fails if a dead-letter queue is not enabled. In addition, a dead-lett er queue can be used for investigations or troubleshooting purposes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| lambda-function-de scription | PR.PS-06.08 | Enforcing this control helps ensure AWS Lambda functions have a descripti on. Maintaining this configuration reduces security risk for AWS Lambda resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available in all commercial Regions except Asia Pacific (New Zealand). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| lambda-function-log-format-json | DE.AE-07.02 | JSON-formatted logs are structure d and machine-p arseable, enabling reliable normaliza tion, querying, and downstream triage of Lambda events. Free-text logs are harder to parse consistently, weakening detection and investigation. | Available in all commercial Regions except Asia Pacific (New Zealand). Not available in the AWS GovCloud (US) Regions. |
| lambda-function-pu blic-access-prohibited | DE.CM-01.03, PR.AA-03.02, PR.AA-04.01, PR.AA-05.01 | Lambda function resource policies should not be publicly accessible to prevent unrestricted access to the code stored in the Lambda function. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | DE.AE-03.01, DE.AE-03.02, PR.PS-04.02 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-inside-vpc | PR.PS-01.01, PR.PS-01.03 | By enabling Lambda in VPC, you can improve security and performance when connecting to resources in the VPC, to reduce the rik of man in the middle attack and increase response times. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| lambda-vpc-multi-az-check | GV.RM-09.02, PR.IR-01.03, PR.IR-03.01, PR.IR-04.02 | Deploying AWS Lambda functions across multiple Availability Zones (AZ) ensures availabil ity of critical functions in the event of an AZ outage, or during regular maintenance, and allows organizations to maintain business operations. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-allow-public-overrides-disabled | PR.DS-01.01, PR.PS-01.01 | Amazon Lightsail buckets support a two-layer access model: a bucket-level getObject setting that governs default object visibility, and an allowPublicOverrides flag that, when enabled, permits individual objects to be made publicly readable via public-read ACLs regardless of the bucket-level setting. When allowPublicOverrides is set to true on a bucket whose getObject is configured as private, any object within that bucket can be individually exposed to unauthenticated internet access through the S3 PutObjectAcl API, without changing the bucket-level configuration. This creates a condition where a bucket may appear private at the | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | bucket level while containing publicly accessible objects, making the exposure difficult to detect through bucket-level inspection alone. Disabling allowPublicOverrides ensures that the bucket-level access policy is the authoritative and sole control over object visibility, preventing per-object ACLs from silently widening the access boundary. This control is most effective when applied alongside LIGHTSAIL_BUCKET_GET_OBJECT_PRIVATE, which addresses the separate condition where the bucket-level getObject is itself set to public, a state in which allowPublicOverrides has no additional effect. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-object-versioning-enabled | PR.DS-01.01, PR.DS-01.02, PR.IR-03.01, PR.PS-01.03 | Enforcing this control helps ensure Amazon Lightsail Bucket resources have object versioning enabled to protect against unintended deletions and modifications. Maintaining this configuration reduces security risk for Amazon Lightsail resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). | mq-auto-minor-version-upgrade-enabled | ID.RA-01.03, PR.PS-02.01 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | DE.AE-02.01, DE.AE-03.01, DE.CM-03.01, PR.PS-04.02 | Enabling general logging on Amazon MQ brokers is essential for security monitorin g, operational troubleshooting, and complianc e requirements. General logs capture important broker activities, connectio n events, and operational metrics that are crucial for detecting security incidents, diagnosin g performance issues, and maintaini ng audit trails. Without proper logging, organizat ions lose visibility into message broker operations and may fail to meet regulatory complianc e requirements that mandate comprehen sive logging of messaging infrastru cture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-logging-enabled | PR.PS-04.02, PR.PS-04.03 | Audit logging for Amazon MQ brokers provides detailed trails of activities and connections, useful for security monitoring and forensic investigations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-log-enabled | DE.AE-03.01, PR.PS-04.02, PR.PS-04.03 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | PR.IR-01.01, PR.PS-01.02 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-rabbit-deployment-mode | GV.RM-09.02, PR.IR-03.01, PR.IR-04.02 | Cluster deployment provides high availability for Amazon RabbitMQ brokers in an AWS Region. The cluster deployment ensures that data is replicated to all nodes in the cluster, which can reduce downtime and loss of data in the event of a failure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | PR.AA-03.02, PR.IR-01.01, PR.PS-01.01, PR.PS-01.02 | By default, clients can access an Amazon MSK cluster only if theyre in the same VPC as the cluster. All communication between Kafka clients and an MSK cluster are private by default and streaming data doesnt traverse the internet. However, if an MSK cluster is configured to allow public access, anyone on the internet can establish a connectio n to Apache Kafka brokers that are running within the cluster. This can lead to issues such as unauthorized access, data breaches, or exploitation of vulnerabilities. If you restrict access to a cluster by requiring authentication and authorization measures, you can help protect sensitive information and | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central) . Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | maintain the integrity of your resources. | |
| msk-cluster-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | DE.AE-02.01, DE.AE-07.02, PR.PS-04.01, PR.PS-04.02, PR.PS-04.03, RS.MA-02.01 | Enabling logging for MSK Connect connectors is essential for operational visibility, troubleshooting, and security monitoring. Logs provide critical insights into connector performance, data processing activities, error conditions, and potential security events. Without proper logging, organizations lose the ability to effectively monitor data pipeline operations, diagnose issues, meet compliance requirements for audit trails, and detect suspicious activities or data processing anomalies. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-enhanced-monitoring-enabled | DE.AE-02.01, DE.AE-03.01, PR.IR-04.01, PR.IR-04.02 | Enhanced monitoring is crucial for maintaining operational visibility and performance of Kafka clusters. Without detailed monitoring, organizations may miss critical performance issues or capacity problems. Implementing enhanced monitoring supports better cluster management and troubleshooting. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| msk-in-cluster-node-require-tls | PR.DS-02.01 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting data in transit also reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | PR.AA-01.01, PR.AA-02.01, PR.AA-03.01, PR.AA-03.02, PR.AA-04.01, PR.AA-05.02, PR.PS-01.01 | Disabling unauthenticated access to Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. Unauthenticated access can lead to data breaches, unauthorized data consumption or production, and potential compliance violations. Implementing proper authentication mechanisms ensures that only authorized users and applications can interact with Kafka topics and helps maintain audit trails for access monitoring and compliance reporting. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| multi-region-cloudtrail-enabled | DE.AE-03.01, PR.PS-04.02, PR.PS-04.03 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilities, and proactive security monitoring. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| nacl-no-unrestricted-ssh-rdp | DE.CM-01.03, PR.IR-01.01, PR.IR-01.03, PR.IR-01.05 | Network access control list (NACL) should not allow unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-backup-retention-check | PR.DS-11.01, PR.IR-03.01, PR.IR-04.02, RC.RP-03.01 | Backups help to recover more quickly from a security incident and strengthen the resilience of the systems. Automating backups for Amazon Neptune DB clusters, enables to restore systems to a point in time, and minimize downtime and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| neptune-cluster-cloudwatch-log-export-enabled | DE.AE-03.01, DE.AE-07.02, DE.CM-03.02, DE.CM-03.03, PR.PS-04.02, PR.PS-04.03, RS.MA-02.01 | Configuring Amazon Neptune DB clusters to publish log data (audit and/or slow-query) to a log group in Amazon CloudWatch Logs can facilitate real-time analysis of the log data, and CloudWatch can be leveraged to create alarms, view metrics, and store log records in highly durable storage. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-copy-tags-to-snapshot-enabled | ID.AM-02.01, ID.AM-05.01, ID.AM-08.01 | Identification and inventory of the IT assets is a crucial aspect of governance and security. In order to have visibility of all the Neptune DB clusters to assess their security posture and take action on potential areas of weakness, Snapshots should be tagged in the same way as their parent DB clusters. Enabling this setting ensures that snapshots inherit the tags of their parent database clusters. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-deletion-protection-enabled | PR.DS-01.01, PR.DS-01.02, PR.IR-03.01 | Enabling Amazon Neptune DB cluster deletion protection is an additional layer of protection against accidental or unauthorized database deletion. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | PR.DS-01.01, PR.PS-01.06 | Encrypting Amazon Neptune clusters at rest protects the confidentiality and integrity of data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-iam-database-authentication | PR.AA-02.01, PR.AA-03.01, PR.AA-05.02, PR.PS-06.10 | AWS Identity and Access Management (IAM) database authentication allows users to authenticate to database instances with an authentication token instead of a password, to reduce the risk of use of compromised user credentials. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-multi-az-enabled | PR.IR-03.01, PR.IR-04.02 | Configuring multiple Availability Zones (AZ) for Amazon Neptune DB clusters provides high availability, maintains a synchronous standby replica in a different AZ, and automates failover support in case of disruption of services or regular maintenance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-encrypted | PR.DS-01.01, PR.PS-01.06 | Enabling encryption at rest for Amazon Neptune DB cluster snapshots protects the data against unauthorized access to sensitive data, and helps achieve compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-iam-database-auth-enabled | PR.AA-01.01, PR.AA-02.01, PR.AA-03.01 | Ensuring Neptune cluster snapshots retain IAM database authentication verifies that restored clusters will require AWS Signature Version 4 signed requests rather than database-native credentials. IAM authentication integrates database access with centralized IAM policies, enabling fine-grained access control, credential rotation, and CloudTrail auditability. Without this check, snapshots taken from non-IAM-authenticated clusters could be restored with weaker authentication, bypassing the organization's identity governance controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Europe (Milan), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-public-prohibited | PR.AA-05.01, PR.DS-01.01 | Amazon Neptune DB cluster manual snapshot should be set to private. A public unencrypted manual snapshot is available to all AWS accounts. Public snapshots may result in unintended data exposure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-deletion-protection-enabled | PR.IR-01.02 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that enables you to inspect and filter traffic to, from, or between the Virtual Private Clouds (VPCs). The deletion protection setting protects against accidental deletion of the firewall. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| netfw-logging-enabled | DE.AE-02.01, PR.PS-04.01, PR.PS-04.02, PR.PS-04.03 | Enabling firewall logging for AWS Network Firewall gives detailed information about network traffic, including the time that the stateful engine received a packet flow, detailed information about the packet flow, and any stateful rule action taken against the packet flow. | Available in all commercial Regions except Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| netfw-multi-az-enabled | PR.IR-01.03, PR.IR-03.01, PR.IR-04.02 | By deploying a AWS Network Firewall firewall across multiple AZs, traffic can be balanced and shifted among AZs, which helps in designing highly available solutions. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-policy-rule-group-associated | PR.IR-01.01, PR.IR-01.02 | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | DE.CM-01.03, DE.CM-01.05 | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | DE.CM-09.03, PR.IR-01.01, PR.IR-01.02, PR.PS-01.01, PR.PS-01.03 | Enabling subnet change protection on Network Firewall instances prevents unauthorized modifications to firewall subnet associations, which could compromise network security boundaries and traffic inspection capabilities. This protection helps maintain the integrity of network segmentation policies and ensures that firewall rules continue to be applied to the intended network traffic flows. Without this protection, malicious actors or accidental configuration changes could bypass security controls by modifying subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-cross-zone-load-balancing-enabled | PR.IR-03.01, PR.IR-04.02 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | DE.CM-01.03, PR.IR-01.01, PR.IR-01.03 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | --- | --- | --- | --- |
| opensearch-logs-to-cloudwatch | DE.AE-03.02, PR.PS-04.02, PR.PS-04.03 | Sending OpenSearch logs to CloudWatch can provide a centralized and unified platform for log management, analysis, and monitoring. These logs can provide real-time insights into the OpenSearch environment, detect issues promptly, and optimize its performance, ultimately leading to better operational efficiency and a more responsive user experience. Additionally, CloudWatch's integration with other AWS services enables seamless coordination and holistic visibility across your entire cloud infrastructure. NOTE - To send audit logs to cloudwatch logs requires a two-step process. First enable the audit logs for the domain and | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | second turn on audit logs in OpenSearch dashboards. | |
| opensearch-node-to-node-encryption-check | PR.DS-02.01, PR.IR-01.05, PR.PS-01.06 | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | PR.IR-03.01, PR.IR-04.02 | Primary node fault tolerance is crucial for maintaining OpenSearch cluster reliability. Without sufficient primary nodes, clusters are at risk of service disruptions during node failures. Implementing a three-node primary configuration provides robust fault tolerance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-update-check | ID.RA-01.03, PR.PS-02.01 | Configuring the latest updates for Amazon OpenSearch service domains helps to improve security, optimize performance, maintain compatibility with other systems, and address known bugs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| panorama-package-tagged | ID.AM-02.01, ID.AM-05.01 | AWS Panorama package resources are the deployable application/model bundles run on Panorama Appliance devices for computer-vision at the edge. Enforcing this control helps ensure those AWS Panorama package resources have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes AWS Panorama package resources identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Canada (Central), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | access control (ABAC) where authoriza tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for AWS Panorama resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |
| rds-aurora-mysql-a udit-logging-enabled | DE.AE-03.01, DE.AE-03.02, DE.CM-03.01, DE.CM-03.02, DE.CM-03.03, PR.PS-04.02, PR.PS-04.03, RS.AN-07.01 | Publishing audit logs to CloudWatch Logs enables centraliz ed log aggregati on, analysis, and monitoring. This facilitates security monitoring, incident response, and compliance reporting by providing visibilit y into database activities and potential security events. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | DE.AE-03.01, DE.AE-03.02, DE.CM-03.01, DE.CM-03.02, DE.CM-03.03, PR.PS-04.02, PR.PS-04.03, RS.AN-07.01 | Publishing Aurora PostgreSQL logs to Amazon CloudWatch Logs centralizes database activity for monitoring, alerting, and long-term retention. This supports detection of unauthorized access and anomalous queries, preserves audit trails independently of the database instance, and helps meet logging and compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-automatic-minor-version-upgrade-enabled | ID.RA-01.03, PR.PS-02.01 | AWS RDS will occasionally deprecate minor engine versions and provide new ones for an upgrade. When the last version number within the release is replaced, the version changed is considered minor. With Auto Minor Version Upgrade feature enabled, the version upgrades will occur automatically during the specified maintenance window so your RDS instances can get the new features, bug fixes, and security patches for their database engines. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-auto-minor-version-upgrade-enable | ID.RA-01.03, PR.PS-02.01 | Keeping Amazon Relational Database Service (RDS) clusters up-to-date with the latest minor database engine version ensures timely application of security patches and bug fixes released by AWS. This reduces the possible risk of known vulnerabilities being exploited and maintains a secure and stable database environment. | Available in all commercial Regions except US West (N. California), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-cluster-backup-retention-check | PR.DS-11.01, PR.IR-03.01, PR.PS-01.01 | This control checks whether an RDS DB cluster has a minimum backup retention period. The control fails if the backup retention period is less than the specified parameter value. Unless you provide a customer parameter value, Security Hub uses a default value of 7 days. This control applies to all types of RDS DB clusters including Aurora DB cluster, DocumentDB clusters, NeptuneDB clusters, etc. | Available in all commercial Regions except Asia Pacific (New Zealand). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-cluster-default-admin-check | PR.AA-01.01, PR.PS-01.01 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| rds-cluster-deletion-protection-enabled | PR.IR-03.01 | Enabling RDS database deletion protection is an additional layer of protection against accidental or unauthorized database deletion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | PR.DS-01.01, PR.PS-01.06 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-cluster-iam-authentication-enabled | PR.AA-01.01, PR.AA-02.01, PR.AA-03.01, PR.AA-05.02, PR.DS-01.01 | IAM database authentication allows users to authenticate to database instances with an authentication token instead of a password, to reduce the risk of use of compromised user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-multi-az-enabled | PR.DS-11.01, PR.IR-03.01, PR.IR-04.02 | Configuring RDS DB clusters for multiple availability zones (AZ) ensures the availability of data stored in RDS clusters in the event of an AZ outage, or during regular maintenance. Multi-AZ on RDS provides redundancy and automated failover, allowing businesses to maintain operations of their critical applications and services. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-db-security-group-not-allowed | PR.AA-03.02, PR.DS-01.01, PR.IR-01.01, PR.IR-01.05, PR.PS-01.01, PR.PS-01.03 | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. This includes blocking traffic to and from 0.0.0.0/0. | Available only in US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| rds-enhanced-monitoring-enabled | DE.AE-03.01, PR.IR-04.01, PR.PS-04.02 | With enhanced monitoring, DB instances can be monitored in real time, to provide metrics and visibility on the processes or threads that use the CPU, memory disk, network usage, as well as details about processes running in the instance. These detailed metrics are useful for detection of abnormal operation of the instance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-default-admin-check | PR.AA-01.01, PR.PS-01.01 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-instance-deletion-protection-enabled | PR.IR-03.01 | Enabling RDS database deletion protection is an additional layer of protection against accidental or unauthorized database deletion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-instance-iam-authentication-enabled | PR.AA-01.01, PR.AA-02.01, PR.AA-03.01, PR.AA-05.02, PR.DS-01.01 | IAM database authentication allows users to authenticate to database instances with an authentication token instead of a password, to reduce the risk of use of compromised user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-public-access-check | PR.AA-01.02, PR.AA-05.01, PR.DS-01.01, PR.IR-01.01 | Blocking public access to RDS instances helps keep data safe from unauthorized access, reduces the risk of malicious activitie s, and prevents unnecessary threats. In addition, and if publicly exposed, any brute force attempts logins will lower the database performan ce. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-instance-subnet-igw-check | PR.IR-01.01, PR.IR-01.02 | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-in-backup-plan | PR.DS-11.01 | Failure to backup RDS instances can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuri ng backups to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-last-backup-recovery-point-created | PR.DS-11.01 | Automated backups allow point-in-time recovery for Amazon Relational Database Service (RDS) databases. Enabling this ensures recovery capabilities in the event of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-logging-enabled | DE.AE-02.01, DE.CM-03.01, PR.IR-04.01, PR.PS-04.02, PR.PS-04.03, RS.AN-07.01 | Enabling logging for RDS helps monitor the environment to detect potential suspicious activity and unauthorized access to data. Amazon RDS logs are sent to CloudWatch for redundancy. RDS logging provides a mechanism for maintaining reliability, availability and performance of Amazon RDS. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | PR.DS-02.01, PR.PS-01.06, PR.PS-06.10 | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-multi-az-support | PR.IR-03.01 | Configure multi-AZ deployment for RDS to provide high availability, maintain a synchronous standby replica in a different AZ, and automated failover support in case of disruption of services or regular RDS maintenance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-cluster-copy-tags-to-snapshot-check | ID.AM-02.01, ID.AM-07.01 | Copying tags to DB snapshots helps maintain proper resource tracking, governance, and cost allocation across backup resources. This enables consistent resource identification, access control, and compliance monitoring across both active databases and their snapshots. Properly tagged snapshots improve security operations by ensuring backup resources inherit the same metadata as their source databases. | Available in all commercial Regions except US West (N. California), Asia Pacific (New Zealand), Asia Pacific (Taipei), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | PR.DS-02.01, PR.PS-01.06 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-option-group-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-pgsql-cluster-copy-tags-to-snapshot-check | ID.AM-02.01, ID.AM-07.01 | Copying tags to DB snapshots helps maintain proper resource tracking, governance, and cost allocation across backup resources. This enables consistent resource identification, access control, and compliance monitoring across both active databases and their snapshots. Properly tagged snapshots improve security operations by ensuring backup resources inherit the same metadata as their source databases. | Available in all commercial Regions except US West (N. California), Asia Pacific (New Zealand), Asia Pacific (Taipei), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | DE.AE-03.01, DE.AE-03.02, PR.PS-04.02, PR.PS-04.03 | CloudWatch logging for RDS PostgreSQ L is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | PR.DS-02.01, PR.PS-01.06 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguard s data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | PR.DS-02.01, PR.PS-01.06 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-resources-protected-by-backup-plan | PR.DS-11.01, PR.IR-03.01, RC.RP-01.01 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-snapshots-public-prohibited | PR.AA-03.02, PR.PS-01.01, PR.PS-01.03 | Public RDS snapshots represent a major threat, because the data backed up in that snapshot is accessible to all other AWS accounts. Users can then access and copy your data and can create volumes out of it, resulting in unintended data exposure of your RDS instance. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Melbourne), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |
| rds-snapshot-encrypted | PR.DS-01.01, PR.PS-01.06 | Enabling encryption at rest for RDS cluster snapshots and RDS database protects your data against unauthorized access to sensitive data and helps achieve compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | PR.DS-02.01, PR.PS-01.06 | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | DE.AE-03.01, DE.AE-03.02, PR.PS-04.02, PR.PS-04.03 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | PR.DS-01.01, PR.PS-01.06 | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-audit-logging-enabled | DE.AE-07.02, DE.CM-03.01, DE.CM-03.02, DE.CM-03.03 | Enabling audit logging allows for the recording of activity occurring in Amazon Redshift clusters to CloudWatch or S3. This information can be used for analytics, monitoring, alerting, anomaly detection or for use in investigating security events. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-backup-enabled | PR.DS-11.01 | Snapshots can be used for data recovery or copied to other regions for the creation of new clusters with existing data. Snapshots play an important role in a disaster recovery and data retention requirements, allowing for the survival of an altered or terminated cluster, or for recovery due to security incidents. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-configuration-check | PR.DS-01.01, PR.PS-01.06 | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-kms-enabled | PR.DS-01.01, PR.PS-01.06 | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-cluster-maintenancesettings-check | PR.PS-02.01, PR.PS-02.03 | Updating with the latest security patches and bug fixes reduces vulnerabilities and increases stability. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-multi-az-enabled | GV.OC-04.03, GV.RM-09.02, PR.IR-03.01, PR.IR-04.02 | Enabling Multi-AZ deployment for an Amazon Redshift cluster maintains a standby in a second Availability Zone and fails over automatically if an AZ becomes impaired. This improves the availability and resilience of the data warehouse and reduces the risk of data unavailability during infrastructure failures. | Available in all commercial Regions except US West (N. California) and Mexico (Central) . Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-parameter-group-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Amazon Redshift cluster parameter groups enables inventory tracking and ownership attribution for data warehouse configuration resources. Parameter groups define database engine settings (query behavior, WLM configuration, SSL requirements) applied across one or more Redshift clusters. Without tags, organizations cannot identify which team owns each parameter group, what clusters depend on it, or what configuration purpose it serves, making it difficult to manage configuration changes that propagate to all associated clusters. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-public-access-check | PR.IR-01.01 | Publicly accessible Redshift clusters are assigned a public IP address and exposed to the Internet. Unless you intend for your cluster to be publicly accessible, the cluster should not be configured with PubliclyAccessible set to True. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-subnet-group-multi-az | PR.IR-01.03, PR.IR-03.01, PR.IR-04.02 | Configuring a Redshift cluster subnet group with subnets in more than one Availability Zone allows the cluster to be provisioned or recovered across AZs. This improves availability and resilience and reduces the risk that a single AZ disruption makes the data warehouse unavailable. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-default-admin-check | PR.AA-01.01 | Default credential should be changed after initial setup, to reduce the risks of unauthorized access and potential data breaches due to default or shared credentials. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| redshift-default-db-name-check | PR.PS-01.01, PR.PS-06.10 | Changing default database name at cluster creation obfuscates access, reducing potential for external or unintended entry into the database. Default names are public knowledge and should be changed upon configuration. As an example, a well-known name could lead to inadvertent access if it was used in IAM policy conditions. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-enhanced-vpc-routing-enabled | DE.CM-01.03, PR.IR-01.01, PR.IR-01.03 | By enabling Enhanced VPC routing, Amazon Redshift will force all COPY and UNLOAD traffic between the cluster and data repositories to go through the VPC. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-require-tls-ssl | PR.DS-02.01, PR.PS-01.06 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthori zed access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-admin-check | PR.PS-01.01 | When creating an Amazon Redshift Serverless namespace , you should specify a custom admin username for the namespace. The default admin username is public knowledge. By specifying a custom admin username, you can, for example, help mitigate the risk or effective ness of brute force attacks against the namespace. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain) . Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | PR.PS-01.01, PR.PS-01.03 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-namespace-cmk-encryption | PR.DS-01.01, PR.PS-01.06, PR.PS-06.10 | In Amazon Redshift Serverless, a namespace defines a logical container for database objects. This control periodically checks whether the encryption settings for a namespace specify a customer managed AWS KMS key, instead of an AWS managed KMS key, for encryption of data in the namespace. With a customer managed KMS key, you have full control of the key. This includes defining and maintaining the key policy, managing grants, rotating cryptographic material, assigning tags, creating aliases, and enabling and disabling the key. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | DE.AE-03.01, DE.AE-03.02, DE.AE-07.02, DE.CM-03.01, DE.CM-03.02, PR.PS-01.01, PR.PS-04.02, PR.PS-04.03, RS.AN-07.01, RS.MA-02.01 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | PR.DS-02.01, PR.PS-01.06 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | PR.AA-01.02, PR.AA-03.02, PR.AA-05.01, PR.DS-01.01, PR.DS-01.02, PR.IR-01.01, PR.IR-01.03, PR.PS-01.02 | When a Redshift Serverless workgroup is publicly accessible, its endpoint can be reached from the internet, increasing the risk of unauthorized access and data exfiltration. Disabling public access restricts connectivity to your VPC and trusted networks, reducing the attack surface of the data warehouse. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | DE.CM-01.03, PR.IR-01.01, PR.IR-01.03, PR.PS-01.01, PR.PS-06.10 | If enhanced VPC routing is disabled for an Amazon Redshift Serverless workgroup, Amazon Redshift routes traffic through the internet, including traffic to other services within the AWS network. If you enable enhanced VPC routing for a workgroup, Amazon Redshift forces all COPY and UNLOAD traffic between your cluster and your data repositories through your virtual private cloud (VPC) based on the Amazon VPC service. With enhanced VPC routing, you can use standard VPC features to control the flow of data between your Amazon Redshift cluster and other resources. This includes features such as VPC security groups and endpoint | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | policies, network access control lists (ACLs), and Domain Name System (DNS) servers. You can also use VPC flow logs to monitor COPY and UNLOAD traffic. | |
| redshift-unrestricted-port-access | DE.CM-01.03, PR.AA-03.02, PR.AA-05.01, PR.DS-01.01, PR.DS-01.02, PR.IR-01.01, PR.IR-01.02 | Permitting unrestricted inbound access to the Redshift cluster port (IP address with a /0 suffix) can result in unauthorized access or security incidents. We recommend applying the principal of least privilege access when creating security groups and configuring inbound rules. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| required-tags | ID.AM-02.01 | Tags can help you manage, identify, organize, search for, and filter resources. Tagging can also be used to create new resource construct s for visibility or control (such as grouping together resources that make up a micro-service, application, or workload). Tagging is fundamental to providing enterpris e-level visibility and control. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| resiliencehub-app-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Resilience Hub applications enables inventory tracking, ownership attribution, and criticality classification for resilience-managed workloads. Each Resilience Hub app represents a business application with defined recovery objectives (RTO/RPO). Without tags, organizations cannot identify which team owns each application's resilience posture, what business criticality tier it belongs to, or which compliance requirements apply, making it difficult to prioritize recovery efforts and demonstrate resilience governance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| resiliencehub-resiliencypolicy-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Resilience Hub resiliency policies enables tracking, ownership attribution, and classification of recovery objective definitions. Resiliency policies define RTO and RPO targets used to assess application recovery capability. Without tags, organizations cannot identify which team owns each policy, what criticality tier it represents, or which business applications it governs, making it difficult to maintain accountability for recovery objectives and demonstrate resilience governance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | PR.IR-01.01, PR.IR-01.02, PR.PS-01.02 | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. Not restricting access to ports to only authorized users, can lead to attacks against the availabil ity, integrity and confidentiality of systems. Security Group configurations should not allow ingress traffic from 0.0.0.0, but instead should specify trusted sources per port. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | PR.AA-02.01, PR.AA-03.01, PR.AA-05.02 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentia ls making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | PR.AA-02.01, PR.AA-03.01, PR.AA-05.02 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01, ID.AM-05.02 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-query-logging-enabled | DE.AE-03.01, PR.PS-04.02, PR.PS-04.03 | Enabling logging includes information such as the domain or subdomain that was queried, the date and time of the query, the DNS record type, and the DNS response code. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| route53-recovery-control-cluster-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Route 53 Recovery Control clusters enables inventory tracking, ownership attribution, and criticality classification of disaster recovery infrastructure. A cluster provides the highly available control plane (five redundant Regional endpoints) that hosts routing controls for application failover. Without tags, organizations cannot identify which team owns each cluster, what applications it protects, or what criticality tier applies, making it difficult to prioritize DR operations and demonstrate recovery governance. | Available only in US West (Oregon). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-recovery-readiness-cell-tagged | ID.AM-02.01, ID.AM-05.01 | Amazon Route 53 Application Recovery Controller Recovery Readiness cells are the logical groupings of resources whose readiness for failover is continuously audited. Enforcing this control helps ensure those Route 53 Recovery Readiness cells have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes Route 53 Recovery Readiness cells identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based | Available only in US West (Oregon). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | access control (ABAC) where authoriza tion depends on matching resource and principal tags. Maintaining this configuration reduces security risk for Amazon Route 53 Application Recovery Controlle r resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-recovery-readiness-readiness-check-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Route 53 Recovery Readiness readiness checks enables inventory tracking, ownership attribution, and criticality classification of DR monitoring resources. Readiness checks continuously audit (every minute) whether application replicas maintain matching capacity, configuration, and routing policies to support failover. Without tags, organizations cannot identify which team owns each readiness check, what application it monitors, or what criticality tier applies, making it difficult to verify DR monitoring coverage and demonstrate recovery governance. | Available only in US West (Oregon). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-recovery-readiness-recovery-group-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Route 53 Recovery Readiness recovery groups enables inventory tracking, ownership attribution, and criticality classification of application DR readiness infrastructure. Recovery groups represent applications being monitored for failover readiness, containing cells (replicas) that must match in capacity and configuration. Without tags, organizations cannot identify which team owns each recovery group, what business application it protects, or what criticality tier applies, making it difficult to prioritize DR operations and demonstrate recovery governance. | Available only in US West (Oregon). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-recovery-readiness-resource-set-tagged | ID.AM-02.01, ID.AM-05.01 | Enforcing this control helps ensure Amazon Route 53 Recovery Readiness resource sets have tags. Maintaining this configuration reduces security risk for Amazon Route 53 Application Recovery Controller resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available only in US West (Oregon). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| route53-resolver-firewall-domain-list-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Route 53 Resolver DNS Firewall domain lists enables inventory tracking, ownership attribution, and classification of DNS-level security policy resources. Domain lists define which domains are allowed or blocked for outbound DNS queries from VPCs, forming the organization's DNS threat prevention policy. Without tags, organizations cannot identify which team owns each list, what security function it serves (malware blocking, data exfiltration prevention, compliance allow-listing), or which rule groups depend on it, making it difficult to manage DNS security coverage and respond to changes in the threat landscape. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-resolver-firewall-rule-group-association-tagged | ID.AM-02.01, ID.AM-05.01 | Amazon Route 53 Resolver firewall rule group associations bind a DNS Firewall rule group to a VPC so its domain rules are enforced for that VPC's DNS queries. Enforcing this control helps ensure those firewall rule group associations have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes firewall rule group associations identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | where authoriza tion depends on matching resource and principal tags. | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3express-dir-bucket-lifecycle-rules-check | ID.AM-08.03, ID.AM-08.05 | Amazon S3 Express One Zone, accessed exclusively through directory buckets, is a high-perf ormance storage class optimized for latency-sensitive and compute-i ntensive workloads . Its elevated cost relative to general purpose S3 storage makes uncontrolled object accumulat ion a significant cost risk. Unlike general purpose buckets, directory buckets support only expiration-based lifecycle actions — objects cannot be transitioned to lower-cost storage classes. This means that deletion is the only available mechanism for managing storage growth over time. Lifecycle rules for directory buckets serve two distinct cost control purposes: | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Tokyo), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | expiring objects that have exceeded their useful age, and aborting incomplete multipart uploads that would otherwise continue to consume storage without ever producing a usable object. Without active lifecycle rules, both categories of data accumulate indefinitely, incurring ongoing charges with no operational benefit. This control ensures that every directory bucket has an active lifecycle configuration, establishing a defined retention boundary appropriate to the transient, high-throughput nature of the workloads these buckets are designed to support. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-in-vpc-only | PR.IR-01.01 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-access-point-public-access-blocks | PR.AA-01.02, PR.AA-04.01, PR.AA-05.01, PR.DS-01.01 | Enabling block public access for Amazon S3 access points enhances security by preventing unauthorized access from the public internet, mitigating the risk of data breaches, and ensuring compliance with security best practices and regulatory requirements. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks | PR.AA-03.02, PR.DS-01.01, PR.IR-01.01 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks-periodic | PR.AA-03.02, PR.DS-01.01, PR.IR-01.01 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-acl-prohibited | PR.AA-05.01, PR.DS-01.01 | Simplify access management of S3 data by replacing bucket access control lists with IAM (and other) policies to regulate permissions to S3 buckets. Unless there is a need to control access to each object individually, disable ACLs and use policies to control ownership and access. Object ownership means the bucket owner owns all the objects in the bucket, even when uploaded by different AWS accounts, and allows for easy access management. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-cross-region-replication-enabled | PR.DS-11.01, PR.IR-03.01 | Cross-Region Replication is essential for maintaining data availability and disaster recovery capabilities. Without replication, organizations risk data loss in case of region-wide outages. Implementing Cross-Region Replication enhances data durability and supports business continuity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-default-lock-enabled | DE.CM-09.01, DE.CM-09.03, PR.DS-11.01 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | PR.AA-03.02, PR.DS-01.01, PR.IR-01.01, PR.PS-01.01, PR.PS-01.03, PR.PS-04.03, RS.AN-07.01 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-logging-enabled | DE.AE-03.01, DE.CM-03.01, PR.PS-04.02 | Server access logging provides a mechanism to detect potential cybersecurity events, unauthorized access and suspicious activity. Each access log record provides details about a single access request and contains the requester, bucket name, request time, request action, response status, and an error code, if relevant. Server access logs are sent from a source bucket to a chosen target S3 bucket in the same AWS Region to ensure redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-mfa-delete-enabled | PR.AA-03.01, PR.AA-05.02, PR.DS-01.01 | Enabling MFA delete for Amazon S3 buckets ensures that critical objects cannot be deleted without an additional layer of authentication, reducing the risk of accidental or malicious data loss and enhancing overall data protection and security. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-bucket-policy-grantee-check | PR.AA-01.02, PR.AA-04.01, PR.AA-05.01, PR.DS-01.01 | S3 bucket policies help achieve more specific access permissions and authorizations to keep data protected from unauthorized users. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-read-prohibited | DE.CM-01.03, PR.AA-03.02, PR.AA-05.01, PR.DS-01.01, PR.IR-01.01, PR.PS-01.02 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-write-prohibited | DE.CM-01.03, PR.AA-03.02, PR.AA-05.01, PR.DS-01.01, PR.IR-01.01, PR.PS-01.02 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-replication-enabled | GV.OC-05.03, GV.OC-05.04, PR.DS-11.01, PR.IR-03.01, PR.IR-04.02, RC.RP-03.01 | Enabling S3 cross-region replication is crucial for ensuring data availability, durability, and compliance. It helps protect against data loss, regional outages, and provides a mechanism for disaster recovery. By replicating data to a different region, organizations can maintain business continuity and meet regulatory requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-server-side-encryption-enabled | PR.DS-01.01, PR.PS-01.06 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-ssl-requests-only | PR.DS-02.01, PR.PS-01.06 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01, ID.AM-05.02 | Tagging S3 buckets is essential for effective resource managemen t, cost allocation, and governance. Tags enable organizat ions to categorize buckets by purpose, owner, environment, or project, facilitat ing accurate cost tracking and billing. Proper tagging also supports automated resource managemen t, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | PR.AA-05.01, PR.DS-01.01, PR.IR-03.01, PR.PS-01.03 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and applicati on failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanent ly, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encrypt ion-kms | PR.DS-01.01, PR.PS-01.06, PR.PS-01.07 | Protecting objects in S3 using encryptio n at rest with KMS prevents unauthori zed access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-directory-bucket-lifecycle-policy-rule-check | ID.AM-08.03, ID.AM-08.05 | Enforcing this control helps ensure directory buckets for Amazon S3 have a lifecycle policy with at least one enabled rule. Maintaining this configuration reduces security risk for Amazon S3 Express One Zone resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Tokyo), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-event-notifications-enabled | DE.AE-03.01, PR.PS-04.01, PR.PS-04.02 | By enabling event notifications in S3 buckets, alerts can be generated when pre-defined behavior occurs. Notifications from S3 buckets can then trigger prompt response to identified threats and reduce the impact of a security incident. Example events include object ACL PUT, object tagging, S3 lifecycle, new object created, object removal, and more. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-last-backup-recovery-point-created | PR.DS-11.01 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | ID.AM-08.01 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-in-logically-air-gapped-vault | PR.IR-01.01, PR.IR-01.02 | Logical air-gapping is essential for protecting critical S3 data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical S3 bucket data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | PR.DS-11.01, PR.IR-03.01, PR.IR-04.02 | Performing data backups is critical to a disaster recovery plan. Data is vulnerable to hardware or software malfunctions or data corruption, cyberattacks, accidental deletion, calamities, and more. Ensuring that data is backed up will mitigate the forementioned risks. IMPORTANT NOTE: You must enable S3 Versioning on your S3 bucket to use AWS Backup for Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | ID.AM-08.01 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| sagemaker-app-image-config-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Amazon SageMaker AppImageConfig resources enables inventory tracking and ownership attribution for custom ML image configurations. AppImageConfigs define how custom container images run within SageMaker Studio (kernel specifications, storage mounts). Without tags, organizations cannot identify which team owns each custom image configuration or what ML projects depend on it, making it difficult to manage custom ML environment configurations across data science teams. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-data-quality-job-isolation | DE.CM-01.03, PR.IR-01.01, PR.PS-01.02 | Network isolation reduces the attack surface thereby protecting against unauthorized external access, accidental data exposure and potential data exfiltration. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | DE.CM-01.03, PR.IR-01.01, PR.IR-01.03, PR.IR-01.05 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-configuration-kms-key-configured | PR.DS-01.01, PR.PS-01.06, PR.PS-01.07 | Enabling encryption with AWS KMS protects data at rest in Amazon SageMaker, making it difficult for unauthorized individuals to access or manipulate the data. AWS KMS provides centralized key management, facilitating the management of keys and their lifecycle. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| sagemaker-endpoint-config-prod-instance-count | PR.IR-03.01, PR.IR-04.02 | Limiting the number of production instances for SageMaker endpoints helps control costs and reduce the risk of accidental over-provisioning. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-featureg roup-description | PR.PS-06.08 | Requiring descripti ons on SageMaker FeatureGroups ensures ML data assets are documente d for discovera bility, governanc e, and complianc e. Feature groups store ML training and inference data that may contain sensitive informati on (PII, financial , health records). Without descripti ons, data scientists and security teams cannot determine what data a feature group contains, where it originate d, or what sensitivi ty applies, making it difficult to enforce data governance policies and meet audit requirements for ML data assets. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | ID.AM-02.01 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-image-description | PR.PS-06.08 | Requiring descriptions for SageMaker images enhances operational visibility and governance by providing essential metadata about image contents, purpose, and usage. Proper documentation through descriptions facilitates image management, enables teams to understand image functionality, supports compliance auditing, and reduces the risk of using inappropriate or outdated images in machine learning workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-image-tagged | ID.AM-02.01, ID.AM-05.01 | SageMaker images are container images used to run SageMaker notebooks, jobs, and models. Enforcing this control helps ensure those sagemaker images have tags. This is a detective check: it evaluates each resource and reports NON_COMPLIANT when no tags are present, or when configured required tag keys are missing (tags beginning with `aws:` are excluded). Consistent tagging makes sagemaker images identifiable in an automated asset inventory, supports ownership accountability and cost allocation, and enables attribute-based access control (ABAC) where authorization depends on matching resource and principal tags. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | Maintaining this configuration reduces security risk for Amazon SageMaker resources and supports consistent, auditable compliance. Without it, resources may drift from the intended secure state and go undetected. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-inferenceexperiment-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging SageMaker Inference Experiments enables asset inventory tracking, cost allocation, and ownership attribution for ML experimentation resources. Inference experiments compare model variants serving production traffic, without tags, organizations cannot identify experiment ownership, associate experiments with specific ML projects, or determine the data sensitivity of the models being evaluated, making it difficult to enforce access controls and meet audit requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-bias-job-encrypt-in-transit | PR.DS-02.01, PR.PS-01.06 | SageMaker Model Bias jobs run Clarify processing containers that communicate with each other across a network fabric. This Config rule checks that this inter-container traffic is encrypted in transit using TLS. Without it, traffic between SageMaker containers (ML processing nodes) crosses internal AWS networking unencrypted. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-bias-job-isolation | DE.CM-01.03, PR.IR-01.01, PR.PS-01.01, PR.PS-01.02 | Network isolation prevents SageMaker model bias jobs from communicating with external resources over the internet. By enabling network isolation, you ensure that the jobs containers cannot make outbound connections, reducing the attack surface and protecting sensitive data from exfiltration. This is particularly important for jobs processing regulated or sensitive data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | PR.IR-01.01 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | DE.CM-01.03, PR.IR-01.01, PR.PS-01.01, PR.PS-01.02 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-private-registry-required | PR.PS-01.01 | Using a private Docker registry in a VPC for SageMaker model containers ensures container images are pulled from trusted, controlled sources within your VPC. Also, it ensures container images are accessed through VPC endpoints, without traversing the public internet. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Ireland) , Europe (London), Europe (Milan), Europe (Paris), Europe (Stockholm), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-quality-job-encrypt-in-transit | PR.DS-02.01, PR.PS-01.06 | Inter-container traffic encryption protects data transmitted between containers during distributed model quality monitoring jobs. By default, inter-container traffic is unencrypted. Enabling encryption helps maintain data confidentiality during processing and supports compliance with regulatory requirements for data in transit protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-monitoring-schedule-isolation | PR.IR-01.01, PR.PS-01.01 | Network isolation prevents monitoring jobs from making outbound network calls, reducing the attack surface by eliminating internet access from containers. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | --- | --- | --- | --- |
| security-account-information-provided | DE.AE-06.01, RS.CO-02.01, RS.CO-02.03 | Alternate security contacts allow AWS to contact another person about issues with and account in case the primary contact is unavailable. Notifications can be from AWS Support, or other AWS service teams about security-related topics associated with AWS account usage. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01, ID.AM-05.02 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | PR.AA-04.01, PR.PS-01.01 | Configuring Service Catalog products as organization shared allows for centralized governance and consistent provisioning across accounts. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ses-malware-scanning-enabled | PR.PS-05.03 | Malware scanning in SES is crucial for protecting email workflows from potential security threats. Without scanning, malicious attachments or spam could infiltrate your systems. Implementing malware scanning helps maintain email security and prevents potential infections. | Available only in US East (N. Virginia), US West (Oregon), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ses-sending-tls-required | PR.DS-02.01, PR.PS-01.06 | By default, Amazon SES uses opportunistic TLS, which means emails can be sent unencrypted if a TLS connection cannot be established with the receiving mail server. Enforcing TLS for email sending ensures that messages are only delivered when a secure encrypted connection can be established. This helps protect the confidentiality and integrity of email content during transmission between Amazon SES and the recipients mail server. If a secure TLS connection cannot be established, the message will not be delivered, preventing potential exposure of sensitive information. While TLS 1.3 is the default delivery method for Amazon SES, | Available in all commercial Regions except Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | without enforcing TLS requirement through configuration sets, messages could potentially be delivered in plaintext if a TLS connection fails. To pass this control, you must configure the TLS Policy to REQUIRE in your SES configuration sets delivery options. When TLS is required, messages are only delivered if a TLS connection can be established with the receiving mail server. | |
| shield-advanced-enabled-autorenew | PR.IR-01.03, PR.IR-04.02 | AWS accounts with active subscriptions to AWS Shield Advanced can ensure continuity of service. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| shield-drt-access | PR.IR-01.03, RS.MA-02.01 | The Shield Response Team (SRT) provides added support with security engineers who specialize in DDoS event response. As an additional layer of support to your AWS Support plan, you can work directly with the SRT, leveraging their expertise as part of your event response workflow. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| signer-signingprofile-tagged | ID.AM-02.01, ID.AM-05.01 | Tagging Device Farm projects enables inventory tracking and ownership attribution for mobile and web application testing workspace s. Projects organize automated test runs against real physical devices. Without tags, organizations cannot identify which developme nt team owns each testing project, what application it tests, or what environment it belongs to, making it difficult to manage testing infrastructure and allocate costs across development teams. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-encrypted-kms | PR.DS-01.01, PR.PS-01.06 | Encrypting data at rest reduces the risk of data stored on disk being accessed by unauthenticated users. This adds a data protection layer from a threat actor attempting to gain unauthorized access to SNS topic data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| sns-topic-message-delivery-notification-enabled | DE.AE-03.01, PR.IR-04.01, PR.PS-04.02 | Logging message delivery status helps provide better operational insight, such as, knowing whether a message was delivered to the Amazon SNS endpoint, identifying the response sent from the Amazon SNS endpoint to Amazon SNS, determining the message dwell time (the time between the publish timestamp and just before handing off to an Amazon SNS endpoint). | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | PR.AA-03.02, PR.AA-05.01, PR.PS-01.01 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| sqs-queue-dlq-check | PR.IR-03.01, PR.IR-04.02 | Dead letter queues are essential for robust message processing architectures as they provide a mechanism to isolate and examine messages that repeatedly fail processing. Without DLQ configuration, failed messages may be lost permanently or continue consuming processing resources through infinite retry loops. This control helps ensure message durability, enables debugging of processing failures, prevents resource exhaustion from problematic messages, and supports compliance requirements for data retention and audit trails in distributed systems. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | --- | --- | --- | --- |
| wafv2-logging-enabled | DE.AE-03.01, PR.PS-04.01, PR.PS-04.02, PR.PS-04.03 | Activity logs generated by Web ACL, in AWS Web Application Firewall actions, can provide useful operational troubleshooting and improvement information to application owners, looking to improve the underlying applications protected by the WAF service. The logs can also be beneficial if false positive blocking actions have been reported. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-logging-enabled | DE.AE-02.01, DE.AE-02.02, DE.AE-03.01, RS.MA-02.01 | Enabling Amazon CloudWatch metrics for AWS Web Application Firewall (WAF) V2 rules and rule groups provides visibility into web traffic patterns, potential threats, and WAF enforcement actions. This data supports security monitoring, incident response, and continuous improvement of web application security posture. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-not-empty | DE.CM-01.03, PR.IR-01.02, PR.IR-01.03 | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-webacl-not-empty | DE.CM-01.03, PR.IR-01.02, PR.PS-01.01 | Web access control lists (ACLs) without any configured rules or rule groups will not perform traffic inspection or filtering, allowing all web traffic to pass through unchecked. Configuring rules or rule groups enables enforcement of web application security policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-classic-logging-enabled | DE.AE-03.01, PR.PS-04.01, PR.PS-04.02, PR.PS-04.03 | Activity logs generated by Web ACL, in AWS Web Application Firewall actions, can provide useful operation al troubleshooting and improveme nt information to application owners, looking to improve the underlying applicati ons protected by the WAF service. The logs can also be beneficia l if false positive blocking actions have been reported. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-rulegroup-not-empty | DE.CM-01.01, DE.CM-01.03, PR.IR-01.03 | AWS Web Application Firewall (WAF) Classic global rule groups, without any configured rules, will not inspect or filter web traffic, potentially allowing malicious or unauthorized traffic to pass through. Configuring rules enables traffic inspection and enforcement of security policies. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| waf-global-rule-not-empty | DE.CM-01.01, DE.CM-01.03, PR.IR-01.02 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| waf-global-webacl-not-empty | DE.CM-01.01, DE.CM-01.03, PR.IR-01.02 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| waf-regional-rulegroup-not-empty | DE.CM-01.01, DE.CM-01.03, PR.IR-01.02 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-regional-rule-not-empty | DE.CM-01.01, DE.CM-01.03, PR.IR-01.02 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| waf-regional-webacl-not-empty | DE.CM-01.01, DE.CM-01.03, PR.IR-01.02 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | GV.OC-04.01, ID.AM-02.01, ID.AM-05.01, ID.AM-05.02 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| workspaces-root-volume-encryption-enabled | PR.DS-01.01, PR.PS-01.06, PR.PS-01.08 | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | PR.DS-01.01, PR.PS-01.06 | User volume encryption is crucial for protecting sensitive user data in virtual desktop environments. Without encryption, user files and data could be exposed if storage systems are compromised. Implementing user volume encryption provides necessary protection for end-user data. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | ID.AM-02.01, ID.AM-05.01 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## Cybersecurity Maturity Model Certification (CMMC) 2.0 - Level 2

This AWS Config managed conformance pack provides a curated mapping between the Cybersecurity Maturity Model Certification (CMMC) Level 2 practices and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more CMMC practices. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** CMMC_LEVEL-2

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 251 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| acm-certificate-expiration-check | SC.L2-3.13.15 | Expired certificates could allow malicious actors to impersonate legitimate entities, potentially leading to data breaches or other security incidents. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-internal-scheme-check | SC.L2-3.13.6 | Internal scheme configuration for Application Load Balancers is critical for maintaining network security boundaries and implementing defense-in-depth | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. This configura tion helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requireme nts that mandate network segmentat ion and controlled access to application infrastructure. | available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-listener-tagged | CM.L2-3.4.1 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibility and enable automated resource lifecycle management through tag-based policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | CM.L2-3.4.1 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | SC.L2-3.13.2 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | AU.L2-3.3.1 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | CM.L2-3.4.1 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-ssl-enabled | SC.L2-3.13.15 | Use SSL certificates with API Gateway to provide an additional layer of security. With this configuration, API Gateway authenticates HTTP requests and allows only those originating from API Gateway to access backend systems, even if the backend is publicly accessible. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | CM.L2-3.4.1 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | CM.L2-3.4.1 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | CM.L2-3.4.1 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | CM.L2-3.4.3 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | CM.L2-3.4.1 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | CM.L2-3.4.1 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-freeform-profile-config-storage | CM.L2-3.4.2 | Storing configuration data in approved AWS services ensures proper security controls, encryption, access management, and audit capabilities. AWS Secrets Manager provides automatic encryption, rotation capabilities, and fine-grained access controls for sensitive configuration data. AWS AppConfig hosted configuration store offers integrated security features and simplified management within the AppConfig service. Using unapproved storage locations may expose configuration data to security risks, lack proper encryption, or bypass organizational governance controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | CM.L2-3.4.1 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | CM.L2-3.4.1 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | SC.L2-3.13.1, SC.L2-3.13.6 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | CM.L2-3.4.1 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | CM.L2-3.4.1 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | SC.L2-3.13.8 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | CM.L2-3.4.2 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | CM.L2-3.4.1 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | SC.L2-3.13.8 | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | CM.L2-3.4.2 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | CM.L2-3.4.1 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | CM.L2-3.4.1 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | CM.L2-3.4.1 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | AC.L2-3.1.3, SC.L2-3.13.1, SC.L2-3.13.6 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | SC.L2-3.13.1 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | AU.L2-3.3.1, AU.L2-3.3.2, SI.L2-3.14.6 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). |---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appstream-fleet-in-vpc | AC.L2-3.1.3, SC.L2-3.13.1 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configura tion supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastru cture. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | SC.L2-3.13.16 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | SC.L2-3.13.8 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | SC.L2-3.13.16 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | AU.L2-3.3.1, SI.L2-3.14.6 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | AU.L2-3.3.1 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | SC.L2-3.13.16 | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | CM.L2-3.4.2 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | SI.L2-3.14.1 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | AU.L2-3.3.1, AU.L2-3.3.2 | Audit logs track and monitor system activities. They provide a record of events that can help you detect security breaches, investigate incidents, and comply with regulations. Audit logs also enhance the overall accountability and transparency of your organization. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| aurora-mysql-cluster-audit-logging | AU.L2-3.3.1, AU.L2-3.3.2, AU.L2-3.3.8, AU.L2-3.3.9 | Database logs can assist with security and access audits and help diagnose availability issues. Audit logs capture a record of database activity, including login attempts, data modifications, schema changes, and other events that can be audited for security and compliance purposes. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-public-ip-disabled | SC.L2-3.13.6 | By disabling public IP assignment, the attack surface for EC2 instances launched via ASGs, the attack surface is reduced by prohibiting direct internet access. Instead, place EC2 instances in private VPC subnets and enforce access through the associated load balancer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-enabled | CM.L2-3.4.2 | Enabled Batch compute environments are essential for maintaining operational continuity and ensuring that batch processing workloads can execute as expected. Disabled compute environments prevent job queues from launching instances and processing jobs, which can lead to application failures, delayed data processing, and potential business impact. Monitoring the enabled state helps detect unintended configuration changes that could disrupt critical batch processing operations and ensures that compute resources remain available for scheduled and on-demand workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | CM.L2-3.4.2 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | vulnerabilities or operational issues. | |
| cloudfront-custom-ssl-certificate | SC.L2-3.13.15 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | CM.L2-3.4.7, SC.L2-3.13.15, SC.L2-3.13.8 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | AC.L2-3.1.3, AC.L2-3.1.5, SC.L2-3.13.1 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | AU.L2-3.3.1, AU.L2-3.3.2 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for read data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | if you configure a multi-Region trail that logs read-only or all types of data events for all S3 buckets. | |
| cloudtrail-all-write-s3-data-event-check | AU.L2-3.3.1, AU.L2-3.3.2 | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-bucket-access-logging | AU.L2-3.3.1, AU.L2-3.3.2 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudtrail-s3-bucket-public-access-prohibited | SC.L2-3.13.1 | Protecting CloudTrail logs from public access is essential for maintaining the security of audit data. Public exposure of audit logs could reveal sensitive information about your infrastructure and operations. Implementing strict access controls prevents unauthorized access to critical security information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-security-trail-enabled | AU.L2-3.3.1 | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudwatch-alarm-action-check | AU.L2-3.3.4, SI.L2-3.14.6, SI.L2-3.14.7 | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-log-group-encrypted | AU.L2-3.3.8 | Although the CloudWatch Log groups are encrypted by default using SSE (Server Side encryption), encrypting Amazon CloudWatch logs with KMS keys enhances the security and protection of sensitive log data. Encrypting logs at rest ensures if unauthorized individuals gain access to the underlying storage infrastructure, they will not be able to read the log data without the encryption key. Encrypting CloudWatch logs provides an additional layer of defense and assists with preventing unauthorized modification or tampering of log data, ensuring the integrity and reliability of the logs for auditing, troublesh | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | ooting, and forensic analysis purposes. | |
| cloudwatch-metric-stream-tagged | CM.L2-3.4.1 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | AU.L2-3.3.1, AU.L2-3.3.2, SI.L2-3.14.6, SI.L2-3.14.7 | Enabling CloudTrail provides essential visibility into your AWS environment by recording API activity and changes, aiding in security monitoring, compliance audits, and troubleshooting incidents. It enhances accountability, enables rapid incident response, and facilitates thorough forensic analysis of events within your cloud infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | SC.L2-3.13.16 | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-log-file-validation-enabled | AU.L2-3.3.8 | Enabling log file validation ensures the integrity of CloudTrail log files by digitally signing log files using cryptographic hash functions verifying log data has not been tampered with or modified providing a mechanism to investigate the event, trace its origin, and understand the impact supportin g effective incident response. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| codebuild-report-group-encrypted-at-rest | SC.L2-3.13.16 | Encrypting CodeBuild report groups is crucial for protectin g sensitive build and test informati on. Unencrypt ed report data could be exposed if storage systems are compromis ed. Implementing encryption adds an essential layer of security for build and test results. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | CM.L2-3.4.1 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). | --- | --- | --- | --- |
| dms-redis-tls-enabled | SC.L2-3.13.8 | TLS provides end-to-end security when data is sent between applications or databases over the internet. When you configure SSL encryption for your DMS endpoint, it enables encrypted communication between the source and target databases during the migration process. This helps prevent eavesdropping and interception of sensitive data by malicious actors. Without SSL encryption, sensitive data may be accessed, resulting in data breaches, data loss, or other security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-sourcedb-logging | AU.L2-3.3.1, AU.L2-3.3.3 | Proper logging of DMS replication tasks is crucial for maintaining operational visibility and ensuring data integrity. Without adequate logging, issues in the replication process might go undetected, potentially leading to data inconsistencies. Configuring appropriate logging supports efficient troubleshooting and monitoring of migration processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-tagged | CM.L2-3.4.1 | Proper tagging of DMS replication tasks enables effective resource managemen t, cost allocatio n, and governanc e. Tags facilitate tracking of migration projects, identifying resource ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into their migration activities and cannot effective ly manage costs or apply security policies across their DMS infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted | SC.L2-3.13.16 | Encrypting Amazon DocumentDB clusters at rest protects sensitive data from unauthorized access if storage is compromised. Without encryption, data stored in DocumentDB clusters remains vulnerable to unauthorized access through direct storage access. Encryption at rest is a critical data protection control that helps meet compliance requirements for sensitive workloads and prevents data breaches by ensuring all cluster data remains encrypted across all storage components. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | SC.L2-3.13.8 | Encryption in transit protects sensitive data as it moves between DocumentDB clients and clusters, preventing unauthorized interception and eavesdropping on database communications. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transmission. Enabling TLS encryption ensures that database credentials, queries, and results remain confidential and maintain integrity during network transmission. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-snapshot-public-restorable-check | AC.L2-3.1.5 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | CM.L2-3.4.1 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | CM.L2-3.4.1 | Proper tagging of EC2 carrier gateways is essential for resource managemen t, cost allocatio n, access control, operational visibilit y. Tags enable organizations to categorize track network infrastru cture component s, implement automated governance policies, maintain complianc e with organizat ional standards. Consistent tagging practices facilitat e resource identific ation, billing attributi on, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-client-vpn-connection-log-enabled | AC.L2-3.1.12, AC.L2-3.1.20 | Enabling logging captures connection details, facilitating monitoring, auditing, and troubleshooting of Client VPN activities and potential security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | CM.L2-3.4.1 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | AC.L2-3.1.3, SC.L2-3.13.1, SC.L2-3.13.4, SC.L2-3.13.6 | Source/destination checking for Amazon EC2 instances and attached ENIs should be enabled and configured consistently across your EC2 instances. Each ENI has its own setting for source/destination checks. If source/destination checking is enabled, Amazon EC2 enforces source/destination address validation, which ensures that an instance is either the source or the destination of any traffic that it receives. This provides an additional layer of network security by preventing resources from handling unintended traffic and preventing IP address spoofing. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | CM.L2-3.4.1 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | CM.L2-3.4.1, CM.L2-3.4.2 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | AC.L2-3.1.1, MA.L2-3.7.1, SC.L2-3.13.15 | Running resources on supported software versions ensures optimal performance, security, and access to the latest features. Regular updates safeguard against vulnerabilities, which help ensure a stable and efficient user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | MA.L2-3.7.1 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | CM.L2-3.4.1 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-tagged | CM.L2-3.4.1 | Proper tagging of Network Insights access scopes enables effective resource management, cost allocation, governance across AWS environments. Tags provide essential metadata for tracking resource ownership, purpose, lifecycle management. Consistent tagging practices support automated operations, security policies, compliance reporting requirements. Without adequate tagging, organizations lose visibility into resource utilization patterns struggle to implement effective cost controls access management policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-path-tagged | CM.L2-3.4.1 | Proper tagging of Network Insights paths enables effective resource management, cost allocation, operational governance. Tags facilitate automated resource discovery, support compliance reporting requirements, enable consistent application of organizational policies across network analysis resources. Without standardized tagging, organizations lose visibility into resource ownership, purpose, associated costs, making it difficult to maintain operational control meet regulatory requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-security-group-attached-to-eni | CM.L2-3.4.7 | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-security-group-attached-to-eni-periodic | CM.L2-3.4.7 | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | SC.L2-3.13.11, SC.L2-3.13.16, SC.L2-3.13.6 | For an additional layer of security, you should enable encryption for Amazon EBS volumes. Encryption operations then occur on the servers that host Amazon EC2 instances, which helps ensure the security of both data at rest and data in transit between an instance and its attached EBS storage. Amazon EBS encryption is a straightforward encryption solution for EBS resources associated with your EC2 instances. With EBS encryption, you arent required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | CM.L2-3.4.1 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | AU.L2-3.3.1, AU.L2-3.3.2, AU.L2-3.3.8, AU.L2-3.3.9 | AWS Site-to-Site VPN logs provide you with deeper visibility into your Site-to-Site VPN deployments. With this feature, you have access to Site-to-Site VPN connection logs that provide details on IP Security (IPsec) tunnel establish ment, Internet Key Exchange (IKE) negotiations, and dead peer detection (DPD) protocol messages. Site-to-Site VPN logs can be published to CloudWatch Logs. This feature provides customers with a single consistent way to access and analyze detailed logs for all of their Site-to-Site VPN connections. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | CM.L2-3.4.1 | Proper tagging of VPN connections enables effective resource managemen t, cost allocatio n, governance oversight. Tags facilitate automated operations, security policies, complianc e reporting by providing metadata that identifies resource ownership, purpose, environme nt, other critical attributes. Consisten t tagging practices improve operation al visibility support organizational policies for resource lifecycle managemen t. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | CM.L2-3.4.1 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | CM.L2-3.4.2 | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | CM.L2-3.4.1 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | AC.L2-3.1.3 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-filesystem-ct-encrypted | SC.L2-3.13.16, SC.L2-3.13.6 | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryptio n, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | CM.L2-3.4.1 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | AC.L2-3.1.20, SC.L2-3.13.6 | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | CM.L2-3.4.1 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operational visibility. Tags enable organizations to categorize track add-ons by environment, owner, project, or cost center, facilitating accurate billing resource governance. Consistent tagging practices support automated management workflows, security policies, compliance reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernetes infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | AU.L2-3.3.1 | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | SC.L2-3.13.16 | When you encrypt secrets, you can use AWS Key Management Service (AWS KMS) keys to provide envelope encryption of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryption for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applications by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-rbac-auth-enabled | AC.L2-3.1.2 | RBAC authentication provides fine-grained access control for Redis clusters. Without RBAC, managing access to cache resources could be less secure and more difficult to maintain. Implementing RBAC ensures proper authentication and authorization for cache access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | CA.L2-3.12.3, SI.L2-3.14.6 | Enhanced health reporting in Elastic Beanstalk provides deeper visibility into application health status beyond basic instance health checks. This capability monitors additional metrics including CPU utilization, application latency, and request rates, enabling more effective troubleshooting and faster incident response. Without enhanced health reporting, organizations may experience delayed detection of performance degradation, potentially resulting in extended service disruptions and negative impact on application availability. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-acm-certificate-required | SC.L2-3.13.15, SC.L2-3.13.8 | SSL certificates provided by AWS Certificate Manager (ACM) on Load balancers facilitate the management of certificates, keep data secure and prevent data in transit from Man in the Middle attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | SC.L2-3.13.1, SC.L2-3.13.8 | To encrypt data thats transmitted between a client and a load balancer, Elastic Load Balancer listeners should be configured to use industry-standard security protocols: HTTPS for Application Load Balancers, or TLS for Network Load Balancers. Otherwise, data thats transmitted between a client and a load balancer is vulnerable to interception, tampering, and unauthorized access. Use of HTTPS or TLS by a listener aligns with security best practices and helps ensure the confidentiality and integrity of data during transmission. This is particularly important for applications that handle sensitive information, or must comply with security standards | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | that require encryption of data in transit. | |
| elb-acm-certificate-required | SC.L2-3.13.8 | Encrypt data in transit to maintain the confidentiality and integrity of data as it traverses public and unsecured networks and reduce the risk of unauthorized access to data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | SC.L2-3.13.1 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | CM.L2-3.4.1 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | SC.L2-3.13.15, SC.L2-3.13.8 | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-master-no-public-ip | SC.L2-3.13.6 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | SC.L2-3.13.16 | Encryption at rest for Amazon EMR clusters protects sensitive data stored on cluster instances from unauthorized access. This control helps ensure compliance with data protection regulations and security best practices by detecting EMR configurations that lack proper encryption settings. Monitoring encryption configuration helps prevent data exposure risks and maintains data confidentiality for big data processing workloads. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | SC.L2-3.13.1, SC.L2-3.13.8 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| encrypted-volumes | SC.L2-3.13.6 | Encrypting data at rest on EBS volumes facilitates protection of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-launch-tagged | CM.L2-3.4.1 | Tagging Evidently launches is crucial for maintaining operational visibility and resource management. Proper tagging enables effective resource tracking, cost allocation, and access control. Without structured tagging, organizations may struggle to manage and monitor their feature launches effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| evidently-project-tagged | CM.L2-3.4.1 | Proper tagging of Evidently projects is essential for maintaining project organization and visibility. Tags enable effective resource management, cost tracking, and access control. Without structured tagging, organizations risk losing oversight of their experimentation projects. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-tagged | CM.L2-3.4.1 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentat ion. Proper tagging enables efficient resource managemen t, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | AU.L2-3.3.1 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | CM.L2-3.4.1 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | MP.L2-3.8.9 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | CM.L2-3.4.1 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | AU.L2-3.3.1 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | CM.L2-3.4.1 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | CM.L2-3.4.1 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | AU.L2-3.3.1 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | SC.L2-3.13.16 | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | SI.L2-3.14.7 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | CA.L2-3.12.3, SI.L2-3.14.6, SI.L2-3.14.7 | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | visibility in containerized environments meeting compliance requirements for runtime threat detection. | |
| guardduty-eks-protection-audit-enabled | CA.L2-3.12.3, SI.L2-3.14.3, SI.L2-3.14.6 | EKS Audit Log Monitoring is crucial for maintaining security visibility in Kubernetes environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilities for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | CA.L2-3.12.3, SI.L2-3.14.3, SI.L2-3.14.6 | EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | SI.L2-3.14.6, SI.L2-3.14.7 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | CA.L2-3.12.3, SI.L2-3.14.3, SI.L2-3.14.6 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Lambda Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Lambda Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | SI.L2-3.14.2, SI.L2-3.14.3 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administr ator can enable or disable the Malware Protection feature for the member accounts in the organizat ion. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Malware Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | SI.L2-3.14.2, SI.L2-3.14.3, SI.L2-3.14.6 | RDS Protection is crucial for maintaining database security and detecting potential threats. Without this feature, organizations may miss security incidents targeting their database instances. Enabling RDS Protection provides enhanced security monitoring for database environments. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | CA.L2-3.12.3, SI.L2-3.14.6, SI.L2-3.14.7 | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | SI.L2-3.14.6, SI.L2-3.14.7 | S3 Protection is essential for maintaining security visibility over storage resources. Without this feature, organizations may miss potential security threats targeting their S3 buckets. Enabling S3 Protection enhances threat detection capabilities for storage environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | CM.L2-3.4.1 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | IA.L2-3.5.2, IA.L2-3.5.7, IA.L2-3.5.8 | Attackers can launch a brute force attack and retrieve weak passwords if they do not meet specified requirements. Ensure to setup and enforce strong password configuration requirements to mitigate the risk of password guessing, brute force or dictionary attacks, which could lead to unauthorized access to sensitive data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | AC.L2-3.1.1, AC.L2-3.1.2, AC.L2-3.1.5, AC.L2-3.1.7, AU.L2-3.3.9, SC.L2-3.13.3 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | AC.L2-3.1.4 | To ensure the confidentiality, integrity and availability of AWS resources from accidental or malicious activity, IAM policies containing full administrative privileges must not be permitted. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | AC.L2-3.1.1, AC.L2-3.1.2, AC.L2-3.1.5, AC.L2-3.1.7, AU.L2-3.3.8, AU.L2-3.3.9, SC.L2-3.13.3, SC.L2-3.13.4 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | CM.L2-3.4.1 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | SC.L2-3.13.10 | Expired SSL/TLS server certificates left in IAM can be inadvertently associated with resources, causing failed or insecure connections and weakening trust in the certificate chain. Promptly removing expired certificates reduces the risk of outages and of clients negotiating connections with invalid credentials, and keeps the certificate inventory accurate. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | CM.L2-3.4.1 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-mfa-enabled | IA.L2-3.5.3, MA.L2-3.7.5 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | AC.L2-3.1.1, AC.L2-3.1.2, AC.L2-3.1.7, AU.L2-3.3.9, SC.L2-3.13.3 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | AC.L2-3.1.2 | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| restricted-ssh | AC.L2-3.1.3, SC.L2-3.13.1 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | RA.L2-3.11.2 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | RA.L2-3.11.2, SI.L2-3.14.5 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | RA.L2-3.11.2 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | RA.L2-3.11.2 | Standard Lambda scanning is essential for maintaining security in serverless architectures. Without regular scanning, organizations may miss potential vulnerabilities in their Lambda runtime environments. Implementing standard scanning helps ensure comprehensive Lambda function security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| internet-gateway-authorized-vpc-only | AC.L2-3.1.3, SC.L2-3.13.1 | This control provides a mechanism that forces attention on which VPC(s) should be allowed to access the public internet. This control will require the appropriate VPC(s) to be identified and labeled as approved for internet accesses through use of an IGW. Failure to identify and validate the list of authorized VPC's could cause unintended access to AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | CM.L2-3.4.1 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | CM.L2-3.4.1 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | CM.L2-3.4.1 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-gateway-tagged | CM.L2-3.4.1 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | CM.L2-3.4.1 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | CM.L2-3.4.1 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industrial IoT initiatives. Without proper tagging, organizations may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | CM.L2-3.4.1 | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | CM.L2-3.4.2 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | CM.L2-3.4.1 | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | AC.L2-3.1.2, AU.L2-3.3.1 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | SC.L2-3.13.16 | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kms-key-policy-no-public-access | AC.L2-3.1.1, AC.L2-3.1.5 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | CM.L2-3.4.1 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | AU.L2-3.3.1, SI.L2-3.14.7 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | CM.L2-3.4.1 | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-certificate-tagged | CM.L2-3.4.1 | Tagging Lightsail certificates enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking certificate ownership, purpose, and lifecycle management. Consistent tagging practices improve operational visibility, facilitate automated management tasks, and support compliance requirements by ensuring all SSL/TLS certificates can be properly identified and categorized within the infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-disk-tagged | CM.L2-3.4.1 | Proper tagging of Lightsail disks enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support complianc e requirements for asset identification. Without consistent tagging, organizat ions lose visibility into resource utilizati on, struggle with cost attribution, and face challenge s in implement ing automated management workflows. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | AC.L2-3.1.1 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-single-instance-broker-storage-type-efs | MA.L2-3.7.1 | Using EFS storage type for Amazon MQ ActiveMQ single-instance brokers provides enhanced durability, availability, and performance characteristics compared to other storage options. EFS offers automatic scaling, built-in redundancy across multiple Availability Zones, and better integration with AWS backup and recovery services. This storage configuration helps ensure message persistence, reduces the risk of data loss during broker failures, and supports better disaster recovery capabilities for messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | AU.L2-3.3.1 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-log-enabled | AU.L2-3.3.1 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | SC.L2-3.13.6 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | AC.L2-3.1.20, AC.L2-3.1.3, SC.L2-3.13.6 | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-cluster-tagged | CM.L2-3.4.1 | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | AU.L2-3.3.1 | Enabling logging for MSK Connect connectors is essential for operational visibility, troubleshooting, and security monitoring. Logs provide critical insights into connector performance, data processing activities, error conditions, and potential security events. Without proper logging, organizations lose the ability to effectively monitor data pipeline operations, diagnose issues, meet compliance requirements for audit trails, and detect suspicious activities or data processing anomalies. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | AC.L2-3.1.1, AC.L2-3.1.5, IA.L2-3.5.1, IA.L2-3.5.2 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | AU.L2-3.3.1, AU.L2-3.3.2 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nacl-no-unrestricted-ssh-rdp | AC.L2-3.1.20, AC.L2-3.1.3, SC.L2-3.13.1 | Network access control list (NACL) should not allow unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | SC.L2-3.13.16 | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-logging-enabled | SC.L2-3.13.1 | Enabling firewall logging for AWS Network Firewall gives detailed information about network traffic, including the time that the stateful engine received a packet flow, detailed information about the packet flow, and any stateful rule action taken against the packet flow. | Available in all commercial Regions except Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-policy-rule-group-associated | AC.L2-3.1.3, SC.L2-3.13.1 | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-stateless-rule-group-not-empty | AC.L2-3.1.14, AC.L2-3.1.3, SC.L2-3.13.1, SC.L2-3.13.6 | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | AC.L2-3.1.3, CM.L2-3.4.5, SC.L2-3.13.1, SC.L2-3.13.6 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewalls subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | SC.L2-3.13.1, SC.L2-3.13.6 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | CM.L2-3.4.1 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | AU.L2-3.3.1, AU.L2-3.3.2 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | CM.L2-3.4.1 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | AC.L2-3.1.20, AC.L2-3.1.3, SC.L2-3.13.1 | Restricting access to the IGW enhances the security of EC2 instances by protecting sensitive data and reduces the potential for data breaches or unauthorized activities. Restricting access to the IGW aligns with the principle of least privilege and allows for implementation of network segmentation and isolation strategies by controlling outbound connections creating communication boundaries between different parts of network infrastructure reducing the occurrence of lateral movement of threats, limits the impact of potential security incidents, and enhances overall network security and resilience. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | AU.L2-3.3.1 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | CM.L2-3.4.1 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-subnet-igw-check | SC.L2-3.13.6 | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | SC.L2-3.13.11, SC.L2-3.13.8 | Data in transit refers to data that moves from one location to another, such as between nodes in a DB cluster or between a DB cluster and a client application. Data can move across the internet or within a private network. Encrypting data in transit reduces the risk of unauthorized users eavesdropping on network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | SC.L2-3.13.1, SC.L2-3.13.8 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your applicati on. Data may move across the internet or within a private network. Encryptin g data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | CM.L2-3.4.1 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | AU.L2-3.3.1 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | AC.L2-3.1.3, SC.L2-3.13.1 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | AC.L2-3.1.3, CM.L2-3.4.2, SC.L2-3.13.1 | Routing Redshift Serverless workgroup traffic through a VPC provides essential network isolation and security controls. VPC routing enables organizations to implement network-level access controls, monitor traffic patterns, and maintain compliance with security frameworks that require private network configurations. This control helps prevent unauthorized external access to data warehouse resources and ensures that sensitive data processing occurs within a controlled network environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-unrestricted-port-access | AC.L2-3.1.3, SC.L2-3.13.6 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implementing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | CM.L2-3.4.1 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | CM.L2-3.4.1 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | AU.L2-3.3.1, AU.L2-3.3.2 | Enabling S3 bucket logging on target S3 buckets allows you to capture all events that might affect objects in a target bucket. Configuring logs to be placed in a separate bucket enables access to log information, which can be useful in security and incident response workflows and provides redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-ssl-requests-only | SC.L2-3.13.15, SC.L2-3.13.8 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-tagged | CM.L2-3.4.1 | Tagging S3 buckets is essential for effective resource managemen t, cost allocation, and governance. Tags enable organizat ions to categorize buckets by purpose, owner, environment, or project, facilitat ing accurate cost tracking and billing. Proper tagging also supports automated resource managemen t, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | AU.L2-3.3.8 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and applicati on failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanent ly, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encrypt ion-kms | MP.L2-3.8.9, SC.L2-3.13.11, SC.L2-3.13.16 | Protecting objects in S3 using encryptio n at rest with KMS prevents unauthori zed access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-event-notifications-enabled | AU.L2-3.3.8 | By enabling event notifications in S3 buckets, alerts can be generated when pre-defined behavior occurs. Notifications from S3 buckets can then trigger prompt response to identified threats and reduce the impact of a security incident. Example events include object ACL PUT, object tagging, S3 lifecycle, new object created, object removal, and more. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | SC.L2-3.13.1 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | CM.L2-3.4.1 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | CM.L2-3.4.1 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | SC.L2-3.13.1 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | SC.L2-3.13.1 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | CM.L2-3.4.1 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | AC.L2-3.1.1 | Portfolio sharing only within Organizations helps ensure that a portfolio isnt shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub recommends using ORGANIZATIONMEMBER ACCOUNT instead of ACCOUNT. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ses-malware-scanning-enabled | SI.L2-3.14.5 | Malware scanning in SES is crucial for protecting email workflows from potential security threats. Without scanning, malicious attachments or spam could infiltrate your systems. Implementing malware scanning helps maintain email security and prevents potential infections. | Available only in US East (N. Virginia), US West (Oregon), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| sns-encrypted-kms | SC.L2-3.13.11, SC.L2-3.13.16 | Encrypting data at rest reduces the risk of data stored on disk being accessed by unauthenticated users. This adds a data protection layer from a threat actor attempting to gain unauthorized access to SNS topic data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | AC.L2-3.1.1, AC.L2-3.1.2 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | AC.L2-3.1.1, AC.L2-3.1.2, AC.L2-3.1.5, IA.L2-3.5.2 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | based application architectures. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | AC.L2-3.1.1, AC.L2-3.1.2, AC.L2-3.1.5, IA.L2-3.5.2 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | AC.L2-3.1.1, AC.L2-3.1.2, AC.L2-3.1.5, IA.L2-3.5.2 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | AU.L2-3.3.1, AU.L2-3.3.2 | SSM Automation is an AWS Systems Manager tool that helps you build automated solutions to deploy, configure, and manage AWS resources at scale using predefined or custom runbooks. To meet operational or security requirements for your organization, you might need to provide a record of the scripts that it runs. You can configure SSM Automation to send the output from aws:executeScript actions in your runbooks to an Amazon CloudWatch Logs log group that you specify. With CloudWatch Logs, you can monitor, store, and access log files from various AWS services. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | CM.L2-3.4.1 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | MP.L2-3.8.5, MP.L2-3.8.9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-resources-in-logically-air-gapped-vault | SC.L2-3.13.1 | Logical air-gapping is essential for protecting critical Storage Gateway data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical Storage Gateway volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| transfer-connector-logging-enabled | AU.L2-3.3.1, AU.L2-3.3.2 | Enabling CloudWatch logging for an AWS Transfer Family connector records file-transfer activity and errors that are essential for monitoring, troubleshooting, and investigating unauthorized or anomalous transfers. Without these logs, malicious activity can go undetected and forensic analysis is limited. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | SC.L2-3.13.8 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | AU.L2-3.3.1, SC.L2-3.13.1 | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. These logs can be used to respond quickly to anomalous traffic and can aid in incident response investigations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | CM.L2-3.4.7 | Having unused network Access Control Lists (ACLs) increases the risk of unauthorized access to VPC EC2 resources and should be removed once not needed any longer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-open-only-to-authorized-ports | AC.L2-3.1.20, AC.L2-3.1.3, SC.L2-3.13.1 | High risk ports are often exposed to the Internet and easily exploitable by attackers. Security groups provide stateful filtering of ingress and egress network traffic to AWS. Security group rules should follow the principal of least privileged access. Unrestricted access (IP address with a /0 suffix) increases the opportunity for malicious activity such as hacking, denial-of-service attacks, and loss of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | AC.L2-3.1.3, SC.L2-3.13.1, SC.L2-3.13.6 | Controlling inbound access to sensitive ports is crucial for maintaining network security. Unrestricted access to ports like SSH (22) or RDP (3389) could lead to unauthorized system access and potential breaches. Implementing strict port access controls helps prevent unauthorized access to resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-vpn-2-tunnels-up | AC.L2-3.1.13, AC.L2-3.1.20 | Ensuring that both VPN tunnels are up for an AWS Site-to-Site VPN connection is important for confirming a secure and highly available connection between an AWS VPC and your remote network. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-logging-enabled | SI.L2-3.14.6, SI.L2-3.14.7 | Enabling Amazon CloudWatch metrics for AWS Web Application Firewall (WAF) V2 rules and rule groups provides visibility into web traffic patterns, potential threats, and WAF enforcement actions. This data supports security monitoring, incident response, and continuous improvement of web application security posture. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | CM.L2-3.4.1 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| workspaces-root-volume-encryption-enabled | SC.L2-3.13.16 | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | SC.L2-3.13.16 | User volume encryption is crucial for protecting sensitive user data in virtual desktop environments. Without encryption, user files and data could be exposed if storage systems are compromised. Implementing user volume encryption provides necessary protection for end-user data. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | CM.L2-3.4.1 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## EU Artificial Intelligence Act (EU AI Act)

This AWS Config managed conformance pack provides a curated mapping between the European Union Artificial Intelligence Act and AWS managed Config rules. It covers Article 9 (Risk Management System), Article 10 (Data Governance), Article 12 (Record-Keeping and Logging), and the network and perimeter, identity, key management, and backup and resilience controls of Article 15 (Accuracy, Robustness and Cybersecurity). Each Config rule applies to a specific AWS resource and relates to one or more EU AI Act controls. An EU AI Act control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**Source identifier:** EU-AI-ACT

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 258 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| access-keys-rotated | Art.15.3 | The credentials are audited for authorize d devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromis | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | ed. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. | East (UAE). Available in the AWS GovCloud (US) Regions. |
| account-part-of-organizations | Art.9.1 | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| acm-certificate-expiration-check | Art.10.2 | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-http-to-https-redirection-check | Art.10.2 | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| alb-waf-enabled | Art.15.2 | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| api-gw-associated-with-waf | Art.15.2 | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | Art.10.1 | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| api-gw-execution-logging-enabled | Art.12.2 | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| api-gw-ssl-enabled | Art.10.2 | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-associated-with-waf | Art.15.2 | AWS WAF enables you to configure rules that allow, block, or monitor web requests based on customizable rules. Associating a web ACL with your AWS AppSync GraphQL APIs helps protect the AI application endpoints against adversarial and malicious requests. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | Art.10.1 | To help protect data at rest, ensure encryption is enabled for Amazon Athena workgroup query results. Because AI dataset query results can be sensitive, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| athena-workgroup-logging-enabled | Art.12.2 | Enabling logging (metrics and query publication) for Amazon Athena workgroups captures a record of query activity. Logging supports security monitoring of queries against AI datasets. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-global-database-encryption-at-rest | Art.10.1 | To help protect data at rest, ensure encryption is enabled for your Amazon Aurora global databases. Because sensitive AI data can exist at rest across the primary and secondary Regions of a global database, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| aurora-mysql-cluster-audit-logging | Art.12.2 | Enabling audit logging for Amazon Aurora MySQL clusters captures a record of database activity. Audit logs support security monitoring and forensics for AI data infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-resources-protected-by-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-group-elb-healthcheck-required | Art.9.3 | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-public-ip-disabled | Art.15.1 | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| autoscaling-multiple-az | Art.15.4 | Configuring Amazon EC2 Auto Scaling groups to span multiple Availability Zones improves the availability of the AI compute fleet if an Availability Zone becomes impaired. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-plan-min-frequency-and-min-retention-check | Art.15.4 | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-encrypted | Art.15.4 | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| backup-recovery-point-manual-deletion-disabled | Art.15.4 | Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-minimum-retention-check | Art.15.4 | To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| beanstalk-enhanced-health-reporting-enabled | Art.9.3 | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-browsercustom-network-mode-not-public | Art.15.1 | Ensure Amazon Bedrock AgentCore custom browser tools do not operate in a public network mode. Preventing public network access limits exposure of the browser tools used by AI agents. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-browsercustom-recording-enabled | Art.12.2 | Enabling recording for Amazon Bedrock AgentCore custom browser tools captures a record of agent browser activity. Recording supports auditing and monitoring of AI agent behavior in production. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-codeinterpreter-networkmode-check | Art.15.1 | Ensure Amazon Bedrock AgentCore code interpreters run in a restricted network mode. Restricting the network mode limits the ability of code executed by an AI agent to reach external networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-gateway-authorizer-enabled | Art.15.3 | Ensure Amazon Bedrock AgentCore gateways have an authorizer configured. Requiring an authorizer enforces authentication and access control on the gateways serving AI agent interactions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| bedrockagentcore-runtime-private-network-required | Art.15.1 | Manage access to AI inference by ensuring Amazon Bedrock AgentCore runtimes operate on a private network rather than with public network access. Private networking prevents public exposure of AI agent inference endpoints. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| bedrock-agentcore-memory-encryption-enabled | Art.10.1 | To help protect data at rest, ensure Amazon Bedrock AgentCore Memory is encrypted with a customer managed AWS Key Management Service (KMS) key. Because agent conversation and context data can be sensitive, enable encryption to help protect that data. | Available only in US East (N. Virginia), US East (Ohio), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrock-agentcore-memory-event-expiry-duration | Art.10.1 | Configuring an event expiry duration for Amazon Bedrock AgentCore Memory limits how long agent memory records are retained. Enforcing retention limits supports data minimization for AI agent context data. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrock-data-source-encryption-enabled | Art.10.1 | To help protect data at rest, ensure your Amazon Bedrock knowledge base data sources are encrypted with a customer managed AWS Key Management Service (KMS) key. Because retrieval-augmente d generation (RAG) data can be sensitive , enable encryption to help protect that data. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| clb-multiple-az | Art.15.4 | Configuring Classic Load Balancers to span multiple Availability Zones improves the availabil ity of the AI services they front. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-associated-with-waf | Art.15.2 | AWS WAF enables you to configure rules that allow, block, or monitor web requests based on customizable rules. Associating a web ACL with your Amazon CloudFront distributions helps protect the AI application content delivery layer against adversarial and malicious requests. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudtrail-s3-dataevents-enabled | Art.12.1 | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-security-trail-enabled | Art.12.1 | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | Art.9.3 | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudwatch-alarm-action-enabled-check | Art.9.3 | Amazon CloudWatch alarms only perform actions when the alarm actions are enabled. Ensuring alarm actions are enabled keeps monitoring and response mechanisms active for AI system health and security metrics. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cloudwatch-log-group-encrypted | Art.12.3 | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloud-trail-cloud-watch-logs-enabled | Art.12.1 | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | Art.12.1 | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloud-trail-encryption-enabled | Art.12.1 | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-log-file-validation-enabled | Art.12.1 | Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cmk-backing-key-rotation-enabled | Art.15.3 | Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-artifact-encryption | Art.10.1 | To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild artifacts. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-envvar-awscred-check | Art.10.3 | Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cognito-user-pool-advanced-security-enabled | Art.15.3 | Amazon Cognito advanced security features detect and respond to compromised credentials and suspicious sign-in activity. Enabling advanced security on user pools helps protect access to AI applications from account takeover. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-mfa-enabled | Art.15.3 | Multi-factor authentication (MFA) adds a layer of protection on top of a user name and password. Enabling MFA on Amazon Cognito user pools reduces the incidents of compromised accounts for the end users who authentic ate to AI applications. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cognito-user-pool-password-policy-check | Art.15.3 | A strong password policy helps prevent credential-based attacks. Ensuring Amazon Cognito user pools enforce minimum complexit y requirements strengthens authentic ation for the users of AI applications. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cw-loggroup-retention-period-check | Art.12.3 | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| db-instance-backup-enabled | Art.15.4 | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-instance-multi-az-enabled | Art.15.4 | Deploying AWS Database Migration Service (DMS) replication instances across multiple Availability Zones improves resilience. Multi-AZ deployment helps maintain the availability of AI data migration pipelines. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| dms-replication-not-public | Art.15.1 | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-autoscaling-enabled | Art.15.4 | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-in-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-pitr-enabled | Art.10.3 | Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-resources-protected-by-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon DynamoDB resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| dynamodb-table-encrypted-kms | Art.10.1 | Ensure that encryptio n is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-throughput-limit-check | Art.9.3 | Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-in-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-optimized-instance | Art.9.3 | An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-protected-by-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-snapshot-block-public-access | Art.10.3 | Manage access to the AWS Cloud by ensuring EBS snapshots cannot be publicly shared at the account level. EBS snapshots of AI compute volumes can contain sensitive data and access control is required. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-snapshot-public-restorable-check | Art.10.3 | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| ec2-ebs-encryption-by-default | Art.10.1 | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-imdsv2-check | Art.15.3 | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-detai led-monitoring-ena bled | Art.9.3 | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitorin g on the Amazon EC2 console, which displays monitorin g graphs with a 1-minute period for the instance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-managed-by-systems-manager | Art.9.2 | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-instance-no-public-ip | Art.15.1 | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-profile-attached | Art.9.3 | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-public-ip-disabled | Art.15.1 | Ensure Amazon EC2 launch templates do not assign public IP addresses to network interfaces. Preventin g public IP assignmen t keeps AI compute instances from being reachable from the internet. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-association-compliance-status-check | Art.9.2 | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-patch-compliance-status-check | Art.9.2 | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-protected-by-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ec2-security-group-attached-to-eni | Art.15.1 | Ensure security groups are attached to Amazon EC2 elastic network interfaces. Properly attached security groups enforce network access controls on AI compute resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-stopped-instance | Art.9.3 | Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-volume-inuse-check | Art.9.3 | This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-logging-enabled | Art.12.2 | Enabling logging for Amazon EC2 VPN connections captures a record of tunnel activity. VPN logs support monitoring of the network paths carrying AI workload traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| ecs-containers-non privileged | Art.15.3 | To assist with implementing the principle of least privilege, Amazon Elastic Container Service (Amazon ECS) task definitio ns should not have elevated privilege enabled. When this parameter is true, the container is given elevated privileges on the host container instance (similar to the root user). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-containers-readonly-access | Art.15.3 | Enabling read only access to Amazon Elastic Container Service (ECS) containers can assist in adhering to the principal of least privilege. This option can reduces attack vectors as the container instance's filesystem cannot be modified unless it has explicit read-write permissions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ecs-container-insights-enabled | Art.9.3 | Amazon CloudWatch Container Insights collects, aggregates, and summarizes metrics and logs from your containerized applications. Enabling Container Insights for Amazon ECS clusters supports operational monitoring of containerized AI services. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-user-for-host-mode-check | Art.15.3 | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-automatic-backups-enabled | Art.15.4 | Enabling automatic backups for Amazon EFS file systems supports recovery of shared AI training data. Automatic backups help protect against data loss. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-encrypted-check | Art.10.1 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-in-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-logging-enabled | Art.12.2 | Amazon EKS control plane logging streams audit and diagnostic logs from the Kubernete s control plane to Amazon CloudWatc h Logs. Enabling control plane logging supports security auditing and incident identification for Kubernetes-based AI workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | Art.10.1 | To help protect data at rest, ensure envelope encryption of Kubernetes secrets is enabled for your Amazon EKS clusters. Because sensitive credentials for AI workloads can exist in Kubernetes secrets, enable encryptio n with AWS Key Management Service (KMS) to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| eks-endpoint-no-pu blic-access | Art.15.1 | Manage access to the AWS Cloud by ensuring the Amazon EKS cluster Kubernetes API server endpoint is not publicly accessible. A private endpoint keeps control of clusters hosting AI workloads within your network boundary. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-rbac-auth-enabled | Art.15.3 | Role-based access control (RBAC) authentication restricts access to Amazon ElastiCache clusters to authorized identities. Enabling RBAC authentication supports least-privilege access to the caching layer used by AI inference pipelines. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-redis-cluster-automatic-backup-check | Art.15.4 | When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup. | Available in all commercial Regions except Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-auto-failover-enabled | Art.15.4 | Automatic failover for Amazon ElastiCache replication groups promotes a replica to primary if the primary node fails. Enabling automatic failover improves the availability of the caching layer serving AI workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-at-rest | Art.10.1 | To help protect data at rest, ensure encryption at rest is enabled for your Amazon ElastiCache replication groups. Because sensitive AI feature data can exist at rest in ElastiCache, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-in-transit | Art.10.2 | To help protect data in transit, ensure encryption in transit is enabled for your Amazon ElastiCache replication groups. Because sensitive AI feature data moves between clients and cache nodes, enable in-transit encryption to protect it from interception. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-encrypted-at-rest | Art.10.1 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elasticsearch-in-vpc-only | Art.10.3 | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-logs-to-cloudwatch | Art.12.2 | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elasticsearch-node-to-node-encryption-check | Art.10.2 | Ensure node-to-node encryptio n for Amazon OpenSearch Service is enabled. Node-to-node encryptio n enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-managed-updates-enabled | Art.9.3 | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-acm-certificate-required | Art.10.2 | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-acm-certificate-required | Art.10.2 | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |
| elb-cross-zone-load-balancing-enabled | Art.15.4 | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-deletion-protection-enabled | Art.15.4 | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elb-logging-enabled | Art.12.2 | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | Art.10.2 | Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-kerberos-enabled | Art.15.3 | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | information about each principal. | |
| emr-master-no-public-ip | Art.15.1 | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| encrypted-volumes | Art.10.1 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| fsx-resources-protected-by-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-job-logging-enabled | Art.12.4 | Enabling logging for AWS Glue jobs captures a record of data pipeline execution. Job logs support auditing and troubleshooting of AI data preprocessing pipelines. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-ml-transform-encrypted-at-rest | Art.10.1 | To help protect data at rest, ensure encryption is enabled for AWS Glue machine learning transforms. Because AI data preparati on can involve sensitive data, enable encryption to help protect that data. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |
| guardduty-ec2-protection-runtime-enabled | Art.9.1 | Amazon GuardDuty EC2 Runtime Monitoring detects threats to Amazon EC2 instances by observing runtime behavior. Enabling this protection helps identify unauthorized or malicious activity on the compute instances that run AI training and inference workloads. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | Art.9.1 | Amazon GuardDuty ECS Runtime Monitoring detects threats to Amazon ECS tasks, including Fargate, by observing runtime behavior. Enabling this protection helps identify malicious activity in containerized AI inference and training tasks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| guardduty-eks-protection-audit-enabled | Art.9.1 | Amazon GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious activity in your Amazon EKS clusters. Enabling this protection helps detect threats against Kubernetes clusters hosting AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | Art.9.1 | Amazon GuardDuty EKS Runtime Monitoring detects threats to Amazon EKS workloads by observing container runtime behavior with automated agent management. Enabling this protection helps identify malicious activity in containerized AI services on Kubernetes. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| guardduty-enabled-centralized | Art.9.1 | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | Art.9.1 | Amazon GuardDuty Lambda Protection monitors network activity from AWS Lambda functions to detect potential threats. Enabling this protection helps identify malicious behavior in serverless AI inference functions . | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| guardduty-malware-protection-enabled | Art.9.1 | Amazon GuardDuty Malware Protection scans Amazon EBS volumes attached to your compute to detect malicious files. Enabling malware protection helps identify threats to the infrastructure hosting AI training and inference before they can compromise data integrity or availability. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-non-archived-findings | Art.9.1 | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | Art.9.1 | Amazon GuardDuty RDS Protection analyzes login activity to your Amazon Aurora databases to detect anomalous access. Enabling this protection helps detect suspicious access to databases supporting AI applications and feature stores. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| guardduty-runtime-monitoring-enabled | Art.9.1 | Amazon GuardDuty Runtime Monitoring observes operating-system-level behavior on your compute resources to detect threats at runtime. Enabling runtime monitoring provides visibility into malicious activity within the environments running AI workloads. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | Art.9.1 | Amazon GuardDuty S3 Protection monitors object-level API operations to identify potential security risks for data within your Amazon S3 buckets. Enabling this protection helps detect anomalous access to the buckets that hold AI training data and model artifacts, supporting continuous threat detection across the AI workload. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-customer-policy-blocked-kms-actions | Art.15.3 | AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-external-access-analyzer-enabled | Art.15.3 | AWS Identity and Access Management (IAM) Access Analyzer identifies resources in your organizat ion and accounts that are shared with an external entity. Enabling an external access analyzer helps detect unintende d access to the resources that hold AI data and models. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| iam-group-has-users-check | Art.15.3 | AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-inline-policy-blocked-kms-actions | Art.15.3 | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-no-inline-policy-check | Art.15.3 | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | --- | --- | --- | --- |
| | | sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | Art.15.3 | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | Art.15.3 | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | Art.15.3 | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-group-membership-check | Art.15.3 | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iam-user-mfa-enabled | Art.15.3 | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | Art.15.3 | This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | Art.15.3 | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (CIS Standard value: 45). The actual value should reflect your organization's policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-ssh | Art.15.1 | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| inspector-ec2-scan-enabled | Art.9.2 | Amazon Inspector EC2 scanning continuously assesses Amazon EC2 instances for software vulnerabilities and unintended network exposure. Enabling scanning helps ensure the compute hosting AI training and inference is free of known vulnerabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-code-scan-enabled | Art.9.2 | Amazon Inspector Lambda code scanning analyzes the custom application code in your AWS Lambda functions for vulnerabilities. Enabling code scanning helps identify insecure code in Lambda-based AI inference pipelines. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| inspector-lambda-standard-scan-enabled | Art.9.2 | Amazon Inspector Lambda standard scanning assesses the dependencies of your AWS Lambda functions for known software vulnerabilities. Enabling standard scanning helps ensure Lambda-based AI workloads do not run vulnerable packages. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instances-in-vpc | Art.15.1 | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| internet-gateway-authorized-vpc-only | Art.15.1 | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | Art.15.4 | Ensure Amazon Kinesis data streams retain records for an adequate period. Sufficient retention supports recovery and reprocessing of AI inference and telemetry data. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-stream-encrypted | Art.10.1 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-cmk-not-scheduled-for-deletion | Art.15.3 | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| kms-key-policy-no-public-access | Art.15.3 | Manage access to encryption keys in the AWS Cloud by ensuring AWS Key Management Service (KMS) key policies do not allow public access. Public access to a KMS key can allow unintended decryption of the AI data and model artifacts the key protects. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| lambda-dlq-check | Art.9.3 | Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-public-access-prohibited | Art.15.3 | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-inside-vpc | Art.15.1 | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints.<br>To properly manage access, AWS Lambda functions should be assigned to a VPC. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| macie-auto-sensitive-data-discovery-check | Art.10.3 | Amazon Macie automated sensitive data discovery continually evaluates your Amazon S3 estate to identify buckets that contain sensitive data such as personally identifia ble information. Enabling automated discovery helps identify and classify sensitive data used in AI training datasets, supporting data governance obligatio ns. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | Art.15.3 | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| multi-region-cloudtrail-enabled | Art.12.1 | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-deletion-protection-enabled | Art.15.4 | Enabling deletion protection on AWS Network Firewall firewalls prevents accidental or unauthorized removal of the network protection safeguarding AI workloads. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| netfw-logging-enabled | Art.12.4 | AWS Network Firewall logging captures flow and alert information for traffic inspected by the firewall. Enabling logging supports network-layer incident identification and forensics for self-hosted AI workloads. | Available in all commercial Regions except Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-multi-az-enabled | Art.15.4 | Deploying AWS Network Firewall across multiple Availability Zones helps maintain network protection and availability for AI workloads if an Availability Zone becomes impaired. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-default-action-fragment-packets | Art.15.2 | AWS Network Firewall stateless default actions for fragmented packets determine how the firewall handles fragmented traffic that does not match a rule. Configuring an appropriate default action (for example, drop) helps enforce network-layer safety for AI workload traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-policy-default-action-full-packets | Art.15.2 | AWS Network Firewall stateless default actions for full packets determine how the firewall handles traffic that does not match a rule. Configuring an appropriate default action (for example, drop) helps enforce network-layer safety for AI workload traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-rule-group-associated | Art.15.2 | An AWS Network Firewall policy defines how your firewall monitors and handles traffic in an Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows, and you define default traffic handling. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | Art.15.2 | An AWS Network Firewall rule group contains rules that define how your firewall processes traffic in your VPC. An empty stateless rule group when present in a firewall policy does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | Art.15.1 | Enabling subnet change protection on AWS Network Firewall prevents unauthorized changes to the subnets the firewall protects, helping maintain consistent network isolation for AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| nlb-cross-zone-load-balancing-enabled | Art.15.4 | Enabling cross-zone load balancing on Network Load Balancers distributes traffic evenly across all registered targets in all Availability Zones, improving the resilience of AI inference endpoints. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | Art.15.1 | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| opensearchserverless-collection-description | Art.10.1 | Ensure Amazon OpenSearch Serverless collections used for AI vector search have descriptions configured. Descriptions support inventory and governance tracking of AI search resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearchserverless-collection-standbyreplicas-enabled | Art.15.4 | Enabling standby replicas for Amazon OpenSearch Serverless collections improves availability. Standby replicas help maintain the availability of the vector search used by AI workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-access-control-enabled | Art.10.1 | Ensure fine-grained access control is enabled on your Amazon OpenSearch Service domains. Fine-grained access control provides enhanced authorization mechanisms to achieve least-privileged access to Amazon OpenSearch Service domains. It allows for role-based access control to the domain, as well as index, document, and field-level security, support for OpenSearch Service dashboards multi-tenancy, and HTTP basic authentication for OpenSearch Service and Kibana. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-audit-logging-enabled | Art.12.2 | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | Art.15.4 | Ensure Amazon OpenSearch Service domains have sufficient data nodes distributed for fault tolerance. Data node fault tolerance improves the availability of the search and vector infrastructure used by AI workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-encrypted-at-rest | Art.10.1 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-https-required | Art.10.2 | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-in-vpc-only | Art.15.1 | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-logs-to-cloudwatch | Art.12.2 | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-node-to-node-encryption-check | Art.10.2 | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | Art.15.4 | Ensure Amazon OpenSearch Service domains have dedicated primary nodes configured for fault tolerance. Primary node fault tolerance improves the stability of the search infrastructure serving AI applications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-update-check | Art.15.4 | Ensure Amazon OpenSearch Service domains are running current software versions with available updates applied. Keeping domains up to date maintains security patches for the AI search infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-automatic-minor-version-upgrade-enabled | Art.9.3 | Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-backup-retention-check | Art.15.4 | Ensure Amazon Aurora and Amazon RDS clusters retain automated backups for an adequate period. Sufficient backup retention supports recovery of AI application data. | Available in all commercial Regions except Asia Pacific (New Zealand). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-cluster-deletion-protection-enabled | Art.15.4 | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | Art.10.1 | To help protect data at rest, ensure encryption is enabled for your Amazon Aurora and Amazon RDS database clusters. Because sensitive AI data can exist at rest in database clusters, enable encryption to help protect that data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-iam-authentication-enabled | Art.15.3 | Enabling AWS Identity and Access Management (IAM) authentication for Amazon Aurora and Amazon RDS clusters replaces password-based access with short-lived tokens. Token-based access supports least-privilege access control for databases supporting AI applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-multi-az-enabled | Art.15.4 | Deploying Amazon Aurora and Amazon RDS clusters across multiple Availability Zones improves database resilience. Multi-AZ deployment helps maintain the availability of databases supporting AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-enhanced-monitoring-enabled | Art.9.3 | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances . When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-default-admin-check | Art.10.3 | As default usernames are public knowledge , changing default usernames can assist in reducing the attack surface for your Amazon Relational Database Service (Amazon RDS) database instance(s). | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-instance-deletion-protection-enabled | Art.15.4 | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-iam-authentication-enabled | Art.15.3 | Enabling AWS Identity and Access Management (IAM) authentication for Amazon RDS instances replaces password-based access with short-lived tokens. Token-based access supports least-privilege access control for databases supporting AI applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-instance-public-access-check | Art.10.3 | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-in-backup-plan | Art.15.4 | To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-logging-enabled | Art.12.2 | To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-mariadb-instan ce-encrypted-in-tr ansit | Art.10.2 | To help protect data in transit, ensure connections to Amazon RDS for MariaDB instances require encryptio n. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-multi-az-support | Art.15.4 | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | Art.10.2 | To help protect data in transit, ensure connections to Amazon RDS for MySQL instances require encryption. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | Art.10.2 | To help protect data in transit, ensure connections to Amazon RDS for PostgreSQL instances require encryption. Requiring secure transport protects AI application data, including pgvector stores, as it moves between clients and the database. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | Art.10.2 | To help protect data in transit, ensure Transport Layer Security (TLS) is required for connections through Amazon RDS Proxy. Requiring TLS protects AI application data as it moves through the proxy to the database. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |
| rds-snapshots-public-prohibited | Art.10.3 | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Melbourne), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-snapshot-encrypted | Art.10.1 | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-sqlserver-encrypted-in-transit | Art.10.2 | To help protect data in transit, ensure connections to Amazon RDS for SQL Server instances require encryption. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | Art.10.1 | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-audit-logging-enabled | Art.12.2 | To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-backup-enabled | Art.15.4 | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-configuration-check | Art.10.3 | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-kms-enabled | Art.10.1 | To help protect data at rest, ensure encryption with AWS Key Managemen t Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-maintenancesettings-check | Art.15.4 | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | Art.15.4 | Deploying Amazon Redshift clusters across multiple Availability Zones improves the resilience of the data warehouse. Multi-AZ deployment helps maintain the availability of Redshift clusters used for AI analytics. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-public-access-check | Art.10.3 | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-default-admin-check | Art.10.3 | As default usernames are public knowledge, changing default usernames can assist in reducing the attack surface for your Amazon Redshift cluster(s). | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-enhanced-vpc-routing-enabled | Art.15.1 | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-require-tls-ssl | Art.10.2 | Ensure that your Amazon Redshift clusters require TLS/SSL encryptio n to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | Art.10.2 | To help protect data in transit, ensure Amazon Redshift Serverless workgroups encrypt connections. In-transit encryption protects AI analytics data as it moves between clients and the workgroup. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | Art.15.1 | Ensure Amazon Redshift Serverles s workgroups route traffic within an Amazon Virtual Private Cloud (Amazon VPC). Keeping traffic within the VPC provides network isolation for AI analytics data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| required-tags | Art.9.6 | Ensure that AI workload resources carry the tags you specify so they can be inventoried and classified. Consisten t tagging enables an inventory of AI systems with their risk tier, intended use, and data sensitivity, supporting governanc e and accountability. You can specify up to six required tag keys. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | Art.15.1 | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | Art.15.3 | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | Art.15.3 | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | Art.10.3 | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | Art.10.3 | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | Art.10.3 | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-policy-grantee-check | Art.10.3 | Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-read-prohibited | Art.10.3 | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-write-prohibited | Art.10.3 | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-replication-enabled | Art.10.3 | Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-server-side-encryption-enabled | Art.10.1 | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-ssl-requests-only | Art.10.2 | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | Art.10.3 | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Adding multi factor authentication (MFA) delete to an S3 bucket requires an additional factor of authentication in order to change the version state of your bucket or to delete and object version. MFA delete can add an additional layer of security in the event security credentials are compromised or unauthorized access is granted. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-default-encryption-kms | Art.10.1 | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-event-notifications-enabled | Art.10.3 | Amazon S3 event notifications can alert relevant personnel of any accidental or intentional modifications on your bucket objects. Example alerts include: new object is creation, object removal, object restoration, lost and replicated objects. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | Art.15.4 | Ensure Amazon S3 buckets are included in an AWS Backup plan. Backup coverage supports recovery of the training data and model artifacts stored in Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-version-lifecycle-policy-check | Art.10.3 | Ensure Amazon S3 lifecycle policies are configured to help define actions that you want Amazon S3 to take during an object's lifetime (for example, transition objects to another storage class, archive them, or delete them after a specified period of time). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-data-quality-job-encrypt-in-transit | Art.10.4 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker data quality job definitions. This protects the integrity of data quality evaluations for AI training data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | Art.15.1 | Manage access to the AWS Cloud by ensuring Amazon SageMaker domains use a customer owned Amazon Virtual Private Cloud (Amazon VPC) for non-EFS traffic. VPC-only access provides network isolation for the AI developme nt and deployment environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-configuration-kms-key-configured | Art.10.1 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| sagemaker-endpoint-config-prod-instance-count | Art.15.4 | Configuring an Amazon SageMaker production endpoint with more than one instance improves the availability and resilience of AI inference services. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-bias-job-encrypt-in-transit | Art.10.4 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker model bias job definitions. This protects the integrity and confidentiality of fairness assessmen ts for AI models. Note: this rule validates encryption of bias jobs, not that bias monitoring is enabled. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-bias-job-isolation | Art.10.4 | Ensure Amazon SageMaker model bias job definitions have network isolation enabled. Network isolation protects the fairness assessment process for AI models. Note: this rule validates isolation of bias jobs, not that bias monitoring is enabled. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-explainability-job-encrypt-in-transit | Art.10.4 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker model explainability job definitions. This protects the integrity of model interpretability evaluations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | Art.15.1 | Deploy Amazon SageMaker models within an Amazon Virtual Private Cloud (Amazon VPC) to provide network isolation for AI model component s. VPC deployment keeps model traffic within your network boundary. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | Art.15.1 | Enabling network isolation on Amazon SageMaker models prevents the model container from making outbound network calls. Network isolation reduces the risk of data exfiltration from AI model components. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-inside-vpc | Art.15.1 | Manage access to the AWS Cloud by ensuring Amazon SageMaker notebook instances are deployed within an Amazon Virtual Private Cloud (Amazon VPC). Deploying notebooks inside a VPC provides network isolation for the AI development environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| sagemaker-notebook-instance-kms-key-configured | Art.10.1 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-root-access-check | Art.15.3 | Disabling root access on Amazon SageMaker notebook instances helps enforce least privilege by preventing users from gaining administrative control of the AI development environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| sagemaker-notebook-no-direct-internet-access | Art.15.1 | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| secretsmanager-rotation-enabled-check | Art.15.3 | This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-scheduled-rotation-success-check | Art.15.4 | Ensure the most recent scheduled rotation of AWS Secrets Manager secrets completed successfully. Successful rotation keeps the credentials used by AI services fresh and reduces the impact of a compromised secret. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-secret-periodic-rotation | Art.15.3 | Ensure AWS Secrets Manager secrets are rotated within a defined period. Regular rotation shortens the time a secret used by AI services is valid and reduces the impact of compromise. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| secretsmanager-secret-unused | Art.15.4 | Identify AWS Secrets Manager secrets that have not been accessed within a defined period. Detecting and removing unused secrets reduces the risk from stale credentials associated with retired AI systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-using-cmk | Art.10.1 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | Art.9.2 | AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| shield-advanced-enabled-autorenew | Art.15.2 | AWS Shield Advanced provides expanded protection against distributed denial of service (DDoS) attacks. Ensuring Shield Advanced subscriptions are set to auto-renew maintains continuous DDoS protection for AI-serving infrastructure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| shield-drt-access | Art.15.2 | AWS Shield Advanced allows you to grant the AWS Shield Response Team (SRT) access to respond to DDoS events on your behalf. Configuring SRT access supports timely incident response for AI-facing infrastructure under attack. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-encrypted-kms | Art.10.1 | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ssm-document-not-public | Art.15.1 | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| subnet-auto-assign-public-ip-disabled | Art.15.1 | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-default-security-group-closed | Art.15.1 | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-endpoint-enabl ed | Art.15.1 | Ensure the AWS services used by AI workloads are reached through Amazon VPC endpoints rather than the public internet. VPC endpoints keep service traffic within the AWS network, reducing exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | Art.12.4 | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | Art.15.1 | This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| vpc-sg-open-only-to-authorized-ports | Art.15.1 | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-sg-port-restriction-check | Art.15.1 | Ensure security groups do not allow unrestricted incoming traffic (from 0.0.0.0/0 or ::/0) to sensitive ports such as SSH (22) and RDP (3389). Restricting these ports reduces the attack surface of AI infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-vpn-2-tunnels-up | Art.15.1 | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-logging-enabled | Art.12.4 | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-logging-enabled | Art.12.4 | Logging on AWS WAFV2 rule groups captures the details of requests evaluated against the rules. Enabling rule group logging supports detailed threat analysis and forensics for traffic to AI application endpoints . | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| wafv2-rulegroup-not-empty | Art.15.2 | To provide effective filtering for AI-facing endpoints, ensure your AWS WAFV2 rule groups contain at least one rule. An empty rule group provides no protectio n when associated with a web ACL. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-webacl-not-empty | Art.15.2 | To protect AI-facing endpoints against adversarial input, ensure your AWS WAFV2 web ACLs contain at least one rule or rule group. An empty web ACL provides no filtering and leaves the protected AI application exposed. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

## FedRAMP Rev. 5 - High Baseline

This AWS Config managed conformance pack provides a curated mapping between the Federal Risk and Authorization Management Program (FedRAMP) Revision 5 High Baseline controls and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more FedRAMP controls. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** FEDRAMP_R5_HIGH

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 373 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-http-to-https-redirection-check | SC-8 (1) | By forcing redirection from HTTP to the secure HTTPs protocol, data is encrypted in transit in both directions: going to and coming from the origin server to maintain confidentiality and prevent malicious actors from unauthorized access to sensitive data such as user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-internal-scheme-check | SC-7, SC-7 (5) | Internal scheme configuration for Application Load | Available in all commercial Regions except Asia Pacific |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. This configura tion helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requireme nts that mandate network segmentat ion and controlled | (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | CM-8, CM-8 (2) | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | SA-15, SA-8 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | SC-28 (1) | When caching is enabled, Amazon API Gateway service caches responses from API endpoint, reduces the number of calls made to an API endpoint and improves the latency of requests to the API. In addition, encrypted REST API caches protect data from unauthorized access. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | AU-12, AU-2, AU-3 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | CM-8, CM-8 (2) | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| appconfig-application-description | SA-5 | Requiring descriptions for AppConfig applications enhances operational visibility and governance by ensuring proper documentation of application purposes and configurations. Well-documented applications improve team collaboration, facilitate troubleshooting, support compliance auditing, and reduce the risk of misconfiguration or unintended changes to critical application settings. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | CM-8 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | CM-8 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | CM-2, CM-6, CM-6 (1), SI-6 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-description | SA-5 | Requiring descriptions for AppConfig deployment strategies enhances operational visibility and governance by ensuring deployment approaches are properly documented. Well-documented deployment strategies facilitate team collaboration, reduce configuration errors, and support compliance requirements by providing clear context about how application configurations are rolled out. This documentation becomes critical during incident response, audits, and knowledge transfer activities. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-replicate-to-ssm | SA-5 | Replicating AppConfig deployment strategies to Systems Manager documents provides centralized configuration management, enhanced auditability, and improved operational visibility. This practice enables teams to maintain consistent deployment patterns across environments, facilitates compliance reporting by creating auditable records of deployment configurations, and supports disaster recovery scenarios by ensuring deployment strategies are preserved in a managed service with built-in versioning and access controls. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-description | SA-5 | Requiring descriptions for AppConfig environments enhances operational visibility and governance by ensuring proper documentation of configuration management resources. Well-documented environments facilitate troubleshooting, change management, and knowledge transfer among team members. This practice supports compliance requirements for maintaining adequate documentation of system components and helps prevent configuration drift by clearly identifying the purpose and scope of each environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | CM-8 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). | appconfig-extension-association-tagged | CM-8 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-freeform-profile-config-storage | CM-2, CM-3, CM-6 | Storing configuration data in approved AWS services ensures proper security controls, encryption, access management, and audit capabilities. AWS Secrets Manager provides automatic encryption, rotation capabilities, and fine-grained access controls for sensitive configuration data. AWS AppConfig hosted configuration store offers integrated security features and simplified management within the AppConfig service. Using unapproved storage locations may expose configuration data to security risks, lack proper encryption, or bypass organizational governance controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-hosted-configuration-version-description | SA-5 | Requiring descriptions for AppConfig hosted configuration versions enhances operational visibility and change management practices. Meaningful descriptions help teams understand the purpose and impact of configuration changes, facilitate troubleshooting during incidents, and maintain proper audit trails for compliance requirements. This practice reduces the risk of deploying unintended configurations and improves collaboration among development and operations teams by providing clear context for each configuration version. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-description | SA-5 | Requiring descriptions for AppIntegrations event integrations enhances operational visibility and maintainability by ensuring each integration is properly documented. Descriptions help teams understand the purpose, scope, and business context of integrations, which is critical for troubleshooting, change management, and knowledge transfer. Well-documented integrations reduce operational risk, improve incident response times, and support compliance requirements that mandate proper documentation of system components and data flows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | CM-8, CM-8 (2) | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| athena-data-catalog-description | SA-5 | Requiring descriptions for Athena data catalogs enhances data governance by ensuring proper documentation of catalog purposes, contents, and usage guidelines. Well-documented catalogs improve data discoverability, facilitate compliance with data management policies, and enable teams to understand data sources and their intended use cases. This practice supports organizational data stewardship efforts and reduces the risk of data misuse or confusion in analytics workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-prepared-statement-description | SA-5 | Requiring descriptions for Athena prepared statements enhances query management, maintainability, and operational transparency. Documented prepared statements enable teams to understand query purposes, facilitate knowledge transfer, and support effective database governance. This practice reduces operational risks by ensuring that complex or frequently-used queries are properly documented for future reference and troubleshooting. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Europe (Milan), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-description | SA-5 | Requiring descriptions for Athena workgroups enhances operational visibility and governance by ensuring workgroups are properly documented with their intended purpose, usage patterns, and ownership information. Well-documented workgroups improve resource management, facilitate troubleshooting, support compliance auditing, and help teams understand the business context of query workloads. This practice is essential for maintaining organized data analytics environments and ensuring proper resource accountability in multi-team organizations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | SC-28, SC-28 (1) | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | CM-2, CM-6 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | SI-2 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | AU-12, AU-2, AU-3, AU-3 (1) | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| aurora-last-backup-recovery-point-created | CP-10 (2) | Maintaining backup recovery points enables efficient data restoration and business continuity for Aurora databases in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-mysql-cluster-audit-logging | AU-12, AU-2, AU-3 | Audit logging is essential for maintaining database security and regulatory compliance by providing detailed records of all database activities, including user connections, queries, and administrative actions. This capability enables security teams to detect unauthorized access attempts, investigate potential security incidents, and meet compliance requirements for data governance. Without audit logging, organizations lack visibility into database operations and cannot effectively monitor for suspicious activities or demonstrate compliance with regulatory frameworks that require | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | comprehensive audit trails. | |
| aurora-resources-in-logically-air-gapped-vault | SC-7, SC-7 (21) | Logical air-gapping is essential for protecting critical database systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical database resources. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-resources-protected-by-backup-plan | CP-10 (2), CP-9 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-group-elb-healthcheck-required | CP-2 (2) | Activating ELB health checks for Auto Scaling groups enables the detection of application-level issues that basic EC2 status checks cannot identify. When an instance fails ELB health checks, Auto Scaling can automatically replace it, maintaining application availability and reducing downtime. Without these enhanced health checks, unhealthy instances might continue serving traffic despite application failures, leading to degraded user experience and potential service disruptions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-public-ip-disabled | SC-7 | By disabling public IP assignment, the attack surface for EC2 instances launched via ASGs, the attack surface is reduced by prohibiting direct internet access. Instead, place EC2 instances in private VPC subnets and enforce access through the associated load balancer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| backup-plan-min-frequency-and-min-retention-check | CP-9 | Data loss can occur if recovery points expire before a defined retention period. By configuring the frequency of backup and retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-encrypted | CP-9 (8), SC-28 (1) | Encrypting data at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-enabled | CM-2, CM-6, CP-2 | Enabled Batch compute environments are essential for maintaining operational continuity and ensuring that batch processing workloads can execute as expected. Disabled compute environments prevent job queues from launching instances and processing jobs, which can lead to application failures, delayed data processing, and potential business impact. Monitoring the enabled state helps detect unintended configuration changes that could disrupt critical batch processing operations and ensures that compute resources remain available for scheduled and on-demand workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | CM-2, CM-3, CM-6 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | vulnerabilities or operational issues. | |
| cloudformation-stack-notification-check | CM-8 (3) | Sending event notifications to an SNS topic allows you to perform real time monitoring of your CloudFormation stacks and proactively manage the provisioning and update process of AWS resources . CloudFormation stacks event notifications help identify unauthorized actions and ensure that AWS resources meet corporate standards and compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Spain), Israel (Tel Aviv), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| cloudfront-custom-ssl-certificate | SC-8 (1) | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-default-root-object-configured | CM-6, SC-7 | Without a default root object configured, requests to the root URL of a CloudFront distribution may expose directory listings or other unintended content. Configuring a default root object ensures that users receive a specific file when accessing the distribution's root URL, reducing the risk of information disclosure and maintaining better control over content delivery. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | SC-13, SC-8, SC-8 (1) | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | AC-3, AC-4, CM-6, SC-7 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-traffic-to-origin-encrypted | SC-8 (1) | Encrypting traffic between CloudFron t distribution and its custom origin will ensure that the environme nt is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-viewer-policy-https | SC-8 (1) | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | AU-12, AU-2, AU-3, AU-3 (1) | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-all-write-s3-data-event-check | AU-12, AU-2, AU-3, AU-3 (1) | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudtrail-s3-bucket-access-logging | AU-12, AU-2, AU-3, AU-3 (1) | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudtrail-security-trail-enabled | AU-12, AU-3 | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | AC-2 (12), AU-5, AU-5 (1), AU-5 (2), AU-7 (1), CA-7, CA-7 (4), CM-11, CM-6, CM-6 (2), SI-4 (5) | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudwatch-alarm-action-enabled-check | SI-4 (5) | CloudWatch Alarms trigger automated notifications and actions when reaching pre-defined thresholds. Disabling CloudWatch alarms will stop continuous monitoring, and delay responses to events affecting critical applications or functions. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

|---|---|---|---|
| | | ooting, and forensic analysis purposes. | |
| cloudwatch-metric-stream-tagged | CM-8, CM-8 (2) | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-cloud-watch-logs-enabled | AU-12, AU-3, AU-9 (2) | Sending CloudTrail logs to CloudWatch Logs will facilitate real-time and historic activity logging based on user, API, resource, and IP address, and provides opportunity to establish alarms and notifications for anomalous or sensitivity account activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-enabled | AC-6 (9), AU-12, AU-2, AU-3 | Enabling CloudTrail provides essential visibility into your AWS environment by recording API activity and changes, aiding in security monitoring, compliance audits, and troubleshooting incidents. It enhances accountability, enables rapid incident response, and facilitates thorough forensic analysis of events within your cloud infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | AU-9, AU-9 (3), SC-28, SC-28 (1) | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-log-file-validation-enabled | AU-9 | Enabling log file validation ensures the integrity of CloudTrail log files by digitally signing log files using cryptographic hash functions verifying log data has not been tampered with or modified providing a mechanism to investigate the event, trace its origin, and understand the impact supportin g effective incident response. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| codebuild-report-group-encrypted-at-rest | SC-13, SC-28, SC-28 (1) | Data at rest refers to data thats stored in persistent, non-volat ile storage for any duration. Encrypting data at rest helps you protect its confident iality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | CM-8, CM-8 (2) | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). | dax-encryption-enabled | SC-28 (1) | Encrypting DynamoDB Accelerator Clusters at rest is essential to safeguard sensitive information and maintain data confidentiality. By employing encryption, organizations can thwart unauthorized access to data, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Spain), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | SC-13, SC-8, SC-8 (1) | HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. You should only allow encrypted connections over TLS to access DAX clusters. However, encrypting data in transit can affect performance. You should test your application with encryption turned on to understand the performance profile and the impact of TLS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| db-instance-backup-enabled | CP-10 (2), CP-9 | Failure to backup RDS instances can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuri ng backups to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-ssl-configured | SC-8 (1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | CM-8, CM-8 (2) | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | accountability across database migration projects. | |
| dms-mongo-db-authentication-enabled | AC-3, AC-4, IA-2, IA-5 (1) | Enabling authentication for MongoDB endpoints is critical for maintaining data security during migrations. Without proper authentication, unauthorized access to sensitive data could occur. Implementing password-based authentication helps protect MongoDB data stores from unauthorized access and potential data breaches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-neptune-iam-authorization-enabled | AC-3, AC-6 | IAM authentication for Neptune endpoints provides robust, scalable access control. Without IAM authentication, managing access to Neptune databases during migrations could be less secure and more complex. Implementing IAM authorization ensures fine-grained control over who can access Neptune data through DMS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-redis-tls-enabled | SC-13, SC-8, SC-8 (1) | TLS provides end-to-end security when data is sent between applications or databases over the internet. When you configure SSL encryption for your DMS endpoint, it enables encrypted communication between the source and target databases during the migration process. This helps prevent eavesdropping and interception of sensitive data by malicious actors. Without SSL encryption, sensitive data may be accessed, resulting in data breaches, data loss, or other security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-sourcedb-logging | AU-12, AU-2, AU-3 | Proper logging of DMS replication tasks is crucial for maintaining operational visibility and ensuring data integrity. Without adequate logging, issues in the replication process might go undetected, potentially leading to data inconsistencies. Configuring appropriate logging supports efficient troubleshooting and monitoring of migration processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-tagged | CM-8, CM-8 (2) | Proper tagging of DMS replication tasks enables effective resource managemen t, cost allocatio n, and governanc e. Tags facilitate tracking of migration projects, identifying resource ownership , implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into their migration activities and cannot effective ly manage costs or apply security policies across their DMS infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-backup-retention-check | CP-10 (2) | Data loss can occur if recovery points expire before a defined retention period. Defining a retention period for backups for Amazon DocumentDB elastic clusters enables restore of systems to a point in time and minimizes downtime and data loss. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted | SC-28, SC-28 (1) | Encrypting Amazon DocumentDB clusters at rest protects sensitive data from unauthorized access if storage is compromised. Without encryption, data stored in DocumentDB clusters remains vulnerable to unauthorized access through direct storage access. Encryption at rest is a critical data protection control that helps meet compliance requirements for sensitive workloads and prevents data breaches by ensuring all cluster data remains encrypted across all storage components. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Encryption in transit protects sensitive data as it moves between DocumentDB clients and clusters, preventing unauthorized interception and eavesdropping on database communications. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transmission. Enabling TLS encryption ensures that database credentials, queries, and results remain confidential and maintain integrity during network transmission. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-in-backup-plan | CP-10 (2), CP-9 | Failure to backup DynamoDB tables can result in a loss of mission critical data in the event of a failure or security incident. Enabling and properly configuring AWS Backup to match the organization's backup requirements is crucial to restore data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-last-backup-recovery-point-created | CP-10 (2) | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Amazon DynamoDB in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-pitr-enabled | CP-10 (2), CP-9 | Implement point in time recovery risk mitigation measures to ensure your data is protected and can be restored to a specific point in the past whenever needed. This helps increase resiliency and availability of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-resources-protected-by-backup-plan | CP-10 (2), CP-9 | Failure to backup DynamoDB tables can result in a loss of mission critical data in the event of a failure or security incident. Enabling and properly configuring AWS Backup to match the organization's backup requirements is crucial to restore data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| dynamodb-table-encrypted-kms | SC-28 (1) | Encryption of data at rest in DynamoDB is enabled by default. Using AWS KMS reduces the operational complexity of managing encryption keys by integrating transparently with DynamoDB. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-table-encryption-enabled | SC-28 (1) | Provide data security and privacy by ensuring encryption is enabled for your DynamoDB tables. | Available in all commercial Regions except Asia Pacific (New Zealand). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-in-backup-plan | CP-9 | Failure to backup EBS volumes can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availabil ity, and recoverab ility, essential for the continuity of operations and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-last-backup-recovery-point-created | CP-9 | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Amazon Elastic Block Store (EBS) volumes in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-resources-in-logically-air-gapped-vault | SC-7, SC-7 (21) | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-protected-by-backup-plan | CP-10 (4), CP-9 | Amazon EC2 backup on AWS involves creating snapshots of your EC2 instances and their attached EBS volumes. These snapshots capture the instance's data at a specific point in time, allowing you to create reliable backups and recover instances in case of data loss or system failures. By utilizing EC2's snapshot and AMI (Amazon Machine Image) features, you can efficiently manage and restore your instances and their data. Not backing up EC2 instances exposes your data to potential loss in the event of hardware failures, accidental deletions, or software errors. Without backups, recovery becomes challenging and time-consuming, risking | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | downtime and data integrity. Regular backups are crucial to mitigate these risks and ensure business continuity. | |
| ebs-snapshot-public-restorable-check | AC-6 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | CM-8, CM-8 (2) | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | CM-8, CM-8 (2) | Proper tagging of EC2 carrier gateways is essential for resource managemen t, cost allocatio n, access control, operational visibilit y. Tags enable organizations to categorize track network infrastru cture component s, implement automated governance policies, maintain complianc e with organizat ional standards. Consistent tagging practices facilitat e resource identific ation, billing attributi on, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | CM-8, CM-8 (2) | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-not-authorize-all | AC-4, SC-7, SC-7 (21), SC-7 (4) | Restricting authorized networks for Amazon VPC Lattice endpoints helps prevent unauthorized access and potential security breaches from untrusted networks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-ebs-encryption-by-default | SC-28 (1) | Sensitive data can exist at rest on EBS volumes. All sensitive data should be protected at rest using strong cryptography, to protect the confidentiality and integrity of information and prevent and protect data in storage. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | AC-4, SC-7, SC-7 (3), SC-7 (5) | Source/destination check is a critical security feature that ensures network interfaces can only send receive traffic that is specifically destined for or originates from the interface. Disabling this check without proper justification can create security vulnerabilities by allowing traffic forwarding potential network bypasses. Monitoring this setting helps maintain network security boundaries, prevents unauthorized traffic routing, ensures compliance with network security policies. This control is particularly important for maintaining the integrity of network traffic flows preventing potential security misconfigurations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | CM-8, CM-8 (2) | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | CM-2, CM-3, CM-6 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-managed-by-systems-manager | CM-2 (2), CM-6, CM-6 (1), CM-7 (5), SI-2 (2) | Amazon EC2 instances managed by AWS SSM helps maintain security and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-launch-template-imdsv2-check | SC-23, SI-2 (2) | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-association-compliance-status-check | AC-10, MA-4 | SSM interactive sessions provide centralized and granular access controls to EC2 instances and enhance reliability along with user attribution in sessions. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-patch-compliance-status-check | SI-2 (2) | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | CM-8, CM-8 (2) | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). |---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | AU-12, AU-2, AU-3, AU-3 (1) | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | CM-8, CM-8 (2) | Proper tagging of VPN connections enables effective resource managemen t, cost allocatio n, governance oversight. Tags facilitate automated operations, security policies, complianc e reporting by providing metadata that identifies resource ownership, purpose, environme nt, other critical attributes. Consisten t tagging practices improve operation al visibility support organizational policies for resource lifecycle managemen t. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | SI-2 (2) | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabi lities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applicati ons. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | CM-8, CM-8 (2) | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | CM-6, CM-6 (1) | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | CM-8, CM-8 (2) | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | SC-7, SC-7 (3), SC-7 (5) | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentation, reduces the attack surface, ensures containers operate within isolated network environments as intended by containerization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | CP-9 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-filesystem-ct-encrypted | SC-28, SC-28 (1) | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryption, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | CM-8, CM-8 (2) | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| efs-in-backup-plan | CP-9 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | AC-3, AC-4, SC-7, SC-7 (5) | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-resources-in-logically-air-gapped-vault | SC-7, SC-7 (21) | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-resources-protected-by-backup-plan | CP-9 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| eip-attached | AC-4, SC-7 | A disassociated Elastic IP (EIP) remains allocated to your account until you explicitly release it. A small hourly charge is incurred for Elastic IP addresses that are not associated with a running EC2 instance. If you no longer need an Elastic IP address, it is recommended that you release it. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | CM-8, CM-8 (2) | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operation al visibility. Tags enable organizat ions to categoriz e track add-ons by environment, owner, project, or cost center, facilitat ing accurate billing resource governanc e. Consistent tagging practices support automated management workflows, security policies, complianc e reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernete s infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | AU-12, AU-2, AU-3, AU-3 (1) | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | SC-12, SC-13, SC-28, SC-28 (1) | When you encrypt secrets, you can use AWS Key Managemen t Service (AWS KMS) keys to provide envelope encryptio n of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryptio n for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applicati ons by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | CP-9 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-redis-cluster-automatic-backup-check | CP-9 | Enabling backups ensures that data is protected against accidental deletion, data corruption, and in the case of a system failure, you can restore your cluster from a backup, minimizin g downtime and ensuring business continuity. Point-in-time backups can restore your cluster to a specific point in time. Backups can be used for testing and development purposes, where a copy of the productio n cluster can be replicated for testing new features, debugging, or other development activitie s without impacting the live environment. | Available in all commercial Regions except Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-at-rest | SC-28 (1) | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-in-transit | SC-8 (1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic, and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-subnet-group-check | AC-4, SC-7 (21) | When launching an Amazon ElastiCac he cluster, a default subnet group is created if one doesn't exist already. The default group uses subnets from the default Virtual Private Cloud (VPC). Using custom subnet groups is more restrictive of the subnets that the cluster resides in, and the networking that the cluster inherits from the subnets. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-description | SA-5 | Application descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand application purposes, enables effective resource governance, assists in troubleshooting and maintenance activities, and ensures accountability in multi-team environments. Well-documented applications also support audit processes and help maintain organizational knowledge as team members change over time. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-version-description | SA-5 | Application version descriptions provide essential documentation for tracking changes, understanding deployment history, and maintaining operational visibility. Proper documentation enables teams to quickly identify the purpose and contents of specific application versions, facilitates troubleshooting and rollback procedures, and supports compliance requirements for change management. Without descriptions, organizations lose critical context about application deployments, making it difficult to manage the application lifecycle effectively and increasing the risk of deploying incorrect or outdated versions. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-environment-description | SA-5 | Environment descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand the purpose and context of each environment, reduces troubleshooting time, and ensures accountability in multi-team environments. This practice is particularly important for maintaining clear separation between development, staging, and production environments while supporting audit trails and change management processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-node-to-node-encryption-check | SC-8 (1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | CA-7, SI-4 | Enhanced health reporting in Elastic Beanstalk provides deeper visibility into application health status beyond basic instance health checks. This capability monitors additional metrics including CPU utilization, application latency, and request rates, enabling more effective troubleshooting and faster incident response. Without enhanced health reporting, organizations may experience delayed detection of performance degradation, potentially resulting in extended service disruptions and negative impact on application availability. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | SC-13, SC-8, SC-8 (1) | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-multiple-az | CP-7 | By distributing traffic to registere d instances in multiple availabil ity zones (AZs) the ELB provides high availability, automatic scaling, and robust security that improves fault-tolerance for cloud resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| elb-acm-certificate-required | SC-8 (1) | Encrypt data in transit to maintain the confidentiality and integrity of data as it traverses public and unsecured networks and reduce the risk of unauthori zed access to data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-cross-zone-load-balancing-enabled | CP-7 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | SC-7, SC-7 (3) | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | CM-8, CM-8 (2) | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | SC-8 (1) | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-master-no-public-ip | SC-7 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | SC-12, SC-13, SC-28, SC-28 (1) | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | SC-13, SC-8, SC-8 (1) | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data processing workloads. | |
| encrypted-volumes | SC-13, SC-28, SC-28 (1) | Encrypting data at rest on EBS volumes facilitates protectio n of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-launch-description | SA-5 | Requiring descriptions for Evidently launches enhances operational visibility and governance by ensuring proper documentation of feature experiments and rollouts. Descriptive metadata helps teams understand the purpose and context of launches, facilitates troubleshooting and audit processes, and supports effective collaboration across development and operations teams. This practice is essential for maintaining organized experimentation workflows and meeting documentation requirements for compliance frameworks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-launch-tagged | CM-8 (2) | Tagging Evidently launches is crucial for maintaining operational visibility and resource management. Proper tagging enables effective resource tracking, cost allocation, and access control. Without structured tagging, organizations may struggle to manage and monitor their feature launches effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-description | SA-5 | Requiring descriptions for CloudWatch Evidently projects enhances operational visibility and governance by ensuring proper documentation of project purposes and objectives. Well-documented projects facilitate team collaboration, simplify project management, enable better resource tracking, and support compliance requirements for maintaining clear audit trails of experimentation activities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-tagged | CM-8 (2) | Proper tagging of Evidently projects is essential for maintaining project organization and visibility. Tags enable effective resource management, cost tracking, and access control. Without structured tagging, organizations risk losing oversight of their experimentation projects. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-description | SA-5 | Requiring descriptions for CloudWatch Evidently segments enhances operational visibility governance by ensuring proper documentation of audience segmentation logic. Well-documented segments improve team collaboration, facilitate troubleshooting of feature flag behaviors, support compliance requirements for change management audit trails. Clear segment descriptions help prevent misconfigurations enable more effective monitoring of experimental features across different user populations. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-tagged | CM-8 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentat ion. Proper tagging enables efficient resource managemen t, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | AU-12, AU-2 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | CM-8, CM-8 (2) | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-entity-type-tagged | CM-8 | Proper tagging of Fraud Detector entity types is essential for maintaining operational visibilit y and control. Tags facilitate effective resource managemen t, cost tracking, and access control implementation. Without structured tagging, organizat ions risk losing oversight of their fraud detection infrastructure and associated resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-label-tagged | CM-8 | Tagging Fraud Detector labels is crucial for maintaining clear visibility and control over fraud detection configurations. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and analyze their fraud detection labels. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-outcome-tagged | CM-8 | Tagging Fraud Detector outcomes is essential for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their fraud detection outcomes and associated analysis capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-variable-tagged | CM-8 | Proper tagging of Fraud Detector variables is crucial for maintaining clear visibility and control over fraud detection configurations. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may face challenges in managing and analyzing their fraud detection variables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | CM-8, CM-8 (2) | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-resources-protected-by-backup-plan | CP-9, CP-9 (5) | Failure to backup Amazon FSx file systems can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | AU-12, AU-2, AU-3, AU-3 (1) | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | CM-8, CM-8 (2) | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | CM-8, CM-8 (2) | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | AU-12, AU-2, AU-3, AU-3 (1) | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | SC-13, SC-28, SC-28 (1) | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | SI-4 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | CA-7, SI-4, SI-4 (2) | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | visibility in containerized environments meeting compliance requirements for runtime threat detection. | |
| guardduty-eks-protection-audit-enabled | AU-6, CA-2 (2), CA-7, SI-4, SI-4 (2) | EKS Audit Log Monitoring is crucial for maintaining security visibility in Kubernetes environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilities for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | CA-7, SI-4, SI-4 (2) | Runtime monitoring is essential for detecting and responding to security threats in containerized environments. Without runtime monitoring, organizations may be unable to detect container-level security incidents in real-time. Implementing automated runtime monitoring enhances container security posture. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | AU-6 (1), AU-7 (1), IR-4, IR-4 (1), SI-4, SI-4 (2), SI-4 (5) | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| guardduty-lambda-protection-enabled | CA-7, SI-4, SI-4 (2), SI-5 | Lambda Protection is crucial for maintaining security visibility in serverless architectures. Without this feature, organizations may miss potential security threats targeting their Lambda functions. Enabling Lambda Protection provides enhanced security monitoring for serverless workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | CA-7, SI-3, SI-4, SI-4 (2) | Malware Protection is essential for maintaining a strong security posture against malicious software. Without this feature, organizations may be vulnerable to undetected malware threats. Implementing Malware Protection enhances threat detection capabilities across AWS resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| guardduty-non-archived-findings | AU-6 (5), AU-7 (1) | Resolving GuardDuty findings is essential to maintaining a secure and resilient cloud environment. By addressing these findings, you proactively mitigate potential security risks and vulnerabilities, safeguarding sensitive data and infrastructure from unauthorized access and malicious activities. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | CA-7, SI-4, SI-4 (2) | RDS Protection is crucial for maintaining database security and detecting potential threats. Without this feature, organizations may miss security incidents targeting their database instances. Enabling RDS Protection provides enhanced security monitoring for database environments. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | CA-7, SI-4, SI-4 (2) | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | CA-7, SI-4, SI-4 (2) | S3 Protection is essential for maintaining security visibility over storage resources. Without this feature, organizations may miss potential security threats targeting their S3 buckets. Enabling S3 Protection enhances threat detection capabilities for storage environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-group-has-users-check | AC-3, AC-6 | AWS IAM user groups that do not contain any users adds unnecessary operational complexit y, increases oversight and could lead to unintentional risk. Ensuring that all user groups have user accounts simplifie s management and oversight and reduces risk. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | CM-8, CM-8 (2) | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | AC-2, IA-2, IA-5, IA-5 (1) | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | AC-3, AC-6, AC-6 (10), AC-6 (5), AU-12 (3), AU-9 (4), CM-5 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | AC-3, CM-5 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | CM-8, CM-8 (2) | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | SC-12, SC-17 | Certificate expiration monitoring is essential for maintaining secure communications. Expired certificates can lead to service disruptions and security vulnerabilities. Regular monitoring helps prevent certificate-related outages and security issues. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | CM-8, CM-8 (2) | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-no-policies-check | AC-3, AU-12 (3), AU-9 (4), CM-5 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | AC-2 (3) | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| restricted-ssh | AC-17 (1), AC-17 (3), AC-4, CM-7, SC-7 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | RA-5 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | CA-2 (2), RA-5 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | CA-2 (2), RA-5 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | RA-5 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| internet-gateway-authorized-vpc-only | AC-4, SC-7, SC-7 (4) | This control provides a mechanism that forces attention on which VPC(s) should be allowed to access the public internet. This control will require the appropriate VPC(s) to be identified and labeled as approved for internet accesses through use of an IGW. Failure to identify and validate the list of authorized VPC's could cause unintended access to AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | CM-8, CM-8 (2) | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | CM-8 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | CM-8 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-gateway-tagged | CM-8 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | CM-8 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | CM-8 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industrial IoT initiatives. Without proper tagging, organizations may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | CM-8, CM-8 (2) | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | IA-5, SC-13 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | CM-8, CM-8 (2) | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | AC-3, SI-4 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | SC-13, SC-28, SC-28 (1) | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | SI-12 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | AC-3, IA-7, SC-12 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | CM-8, CM-8 (2) | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | CA-7, SI-4, SI-4 (2) | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | CM-8, CM-8 (2) | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-certificate-tagged | CM-8, CM-8 (2) | Tagging Lightsail certificates enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking certificate ownership, purpose, and lifecycle management. Consistent tagging practices improve operational visibility, facilitate automated management tasks, and support compliance requirements by ensuring all SSL/TLS certificates can be properly identified and categorized within the infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-disk-tagged | CM-8, CM-8 (2) | Proper tagging of Lightsail disks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for asset identification. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, and face challenges in implementing automated management workflows. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | IA-2 (1), IA-2 (2) | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | IA-2, IA-5 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-single-instance-broker-storage-type-efs | CP-6, CP-6 (1), CP-6 (3) | Using EFS storage type for Amazon MQ ActiveMQ single-instance brokers provides enhanced durability, availability, and performance characteristics compared to other storage options. EFS offers automatic scaling, built-in redundancy across multiple Availability Zones, and better integration with AWS backup and recovery services. This storage configuration helps ensure message persistence, reduces the risk of data loss during broker failures, and supports better disaster recovery capabilities for messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-automatic-minor-version-upgrade-enabled | SI-2 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-auto-minor-version-upgrade-enabled | SI-2, SI-2 (2) | As Amazon MQ releases and supports new broker engine versions, the changes are backward-compatible with an existing application and dont deprecate existing functionality. Automatic broker engine version updates protect you against security risks, help fix bugs, and improve functionality. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | AU-12, AU-2 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-log-enabled | AU-12, AU-2 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | AC-4, SC-7, SC-7 (5) | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | SC-7, SC-7 (21), SC-7 (3), SC-7 (5) | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-cluster-tagged | CM-8, CM-8 (2) | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | AU-12, AU-2, AU-3 | Enabling logging for an Amazon MSK connector captures operational and error events needed to detect anomalous behavior, troubleshoot failures, and support security investigations. Without connector logs, malicious or erroneous activity can go unnoticed and forensic analysis is limited. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-enhanced-monitoring-enabled | CA-7, SI-4 | Enhanced monitoring is crucial for maintaining operational visibility and performance of Kafka clusters. Without detailed monitoring, organizations may miss critical performance issues or capacity problems. Implementing enhanced monitoring supports better cluster management and troubleshooting. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| msk-in-cluster-node-require-tls | SC-8 (1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting data in transit also reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | AC-3, AC-6, IA-2, IA-8 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | AU-12, AU-2, AU-3 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nacl-no-unrestricted-ssh-rdp | AC-17 (1), AC-17 (3), AC-4 | Network access control list (NACL) should not allow unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| neptune-cluster-backup-retention-check | CP-10 (2), CP-9 | Backups help to recover more quickly from a security incident and strengthen the resilience of the systems. Automating backups for Amazon Neptune DB clusters, enables to restore systems to a point in time, and minimize downtime and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | SC-28, SC-28 (1) | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-multi-az-enabled | CP-2 (2), CP-6, CP-7 | Multi-AZ configuration is essential for maintaining database availability and data resilience. Without Multi-AZ, Neptune clusters are vulnerable to single points of failure. Implementing Multi-AZ replication enhances database reliability and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| neptune-cluster-snapshot-encrypted | SC-28 (1) | Enabling encryption at rest for Amazon Neptune DB cluster snapshots protects the data against unauthorized access to sensitive data, and helps achieve compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-multi-az-enabled | AC-4, SC-7, SC-7 (21), SC-7 (4) | By deploying a AWS Network Firewall firewall across multiple AZs, traffic can be balanced and shifted among AZs, which helps in designing highly available solutions. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-rule-group-associated | AC-4, SC-7, SC-7 (21), SC-7 (4) | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | AC-4, SC-7, SC-7 (21), SC-7 (4) | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | AC-6 (10), CM-3, CM-5, CM-6, CM-6 (2), SC-7 | Enabling subnet change protection on Network Firewall instances prevents unauthorized modifications to firewall subnet associations, which could compromise network security boundaries and traffic inspection capabilities. This protection helps maintain the integrity of network segmentation policies and ensures that firewall rules continue to be applied to the intended network traffic flows. Without this protection, malicious actors or accidental configuration changes could bypass security controls by modifying subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-cross-zone-load-balancing-enabled | CP-7 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | SC-7, SC-7 (3), SC-7 (5) | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | CM-8, CM-8 (2) | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | AU-12, AU-2, AU-3 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | CM-8, CM-8 (2) | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | SC-7, SC-7 (21), SC-7 (4) | Restricting access to the IGW enhances the security of EC2 instances by protecting sensitive data and reduces the potential for data breaches or unauthorized activities. Restricting access to the IGW aligns with the principle of least privilege and allows for implementation of network segmentation and isolation strategies by controlling outbound connections creating communication boundaries between different parts of network infrastructure reducing the occurrence of lateral movement of threats, limits the impact of potential security incidents, and enhances overall network security and resilience. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | CP-7 | Configuring OpenSearch domains with at least three data nodes and multi-AZ enabled enhances availability, fault tolerance, scalability, performance, data resilience, and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-https-required | SC-8 (1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-node-to-node-encryption-check | SC-8 (1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | CP-10, CP-2 (2), CP-6, CP-7 | Primary node fault tolerance is crucial for maintaining OpenSearch cluster reliability. Without sufficient primary nodes, clusters are at risk of service disruptions during node failures. Implementing a three-node primary configuration provides robust fault tolerance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3 (1) | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | SC-28 (1) | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-db-security-group-not-allowed | AC-4, SC-7, SC-7 (5) | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. This includes blocking traffic to and from 0.0.0.0/0. | Available only in US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | CM-8, CM-8 (2) | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-subnet-igw-check | SC-7, SC-7 (5) | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-in-backup-plan | CP-10 (2), CP-9 | Failure to backup RDS instances can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuri ng backups to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-last-backup-recovery-point-created | CP-10 (2) | Automated backups allow point-in-time recovery for Amazon Relational Database Service (RDS) databases. Enabling this ensures recovery capabilities in the event of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | CM-8, CM-8 (2) | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3 (1) | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | SC-13, SC-8, SC-8 (1) | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-resources-protected-by-backup-plan | CP-10 (2), CP-9 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3 (1) | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | SC-28, SC-28 (1) | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-backup-enabled | CP-10 (2), CP-9 | Snapshots can be used for data recovery or copied to other regions for the creation of new clusters with existing data. Snapshots play an important role in a disaster recovery and data retention requirements, allowing for the survival of an altered or terminated cluster, or for recovery due to security incidents. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-configuration-check | SC-28 (1) | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-kms-enabled | SC-28 (1) | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | CP-2, CP-2 (2), CP-6, CP-7, CP-7 (1) | Enabling Multi-AZ deployment for an Amazon Redshift cluster maintains a standby in a second Availability Zone and fails over automatically if an AZ becomes impaired. This improves the availability and resilience of the data warehouse and reduces the risk of data unavailability during infrastructure failures. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-subnet-group-multi-az | CP-6, CP-7, CP-7 (1) | Configuring a Redshift cluster subnet group with subnets in more than one Availability Zone allows the cluster to be provisioned or recovered across AZs. This improves availability and resilience and reduces the risk that a single AZ disruption makes the data warehouse unavailable. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-require-tls-ssl | SC-8 (1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | CM-2, CM-6 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | AU-12, AU-2, AU-3 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | CM-3 (6), SC-13, SC-8, SC-8 (1) | An Amazon Redshift Serverless workgroup is a collection of compute resources that groups together compute resources like RPUs, VPC subnet groups, and security groups. Properties of a workgroup include network and security settings. These settings specify whether connections to a workgroup should be required to use SSL to encrypt data in transit. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | SC-7, SC-7 (3), SC-7 (5) | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | AC-4, SC-7, SC-7 (21) | Routing Redshift Serverless workgroup traffic through a VPC provides essential network isolation and security controls. VPC routing enables organizations to implement network-level access controls, monitor traffic patterns, and maintain compliance with security frameworks that require private network configurations. This control helps prevent unauthorized external access to data warehouse resources and ensures that sensitive data processing occurs within a controlled network environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-unrestricted-port-access | AC-4, SC-7, SC-7 (21), SC-7 (3), SC-7 (5) | Permitting unrestricted inbound access to the Redshift cluster port (IP address with a /0 suffix) can result in unauthorized access or security incidents. We recommend applying the principal of least privilege access when creating security groups and configuring inbound rules. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| required-tags | CP-2 (8) | Tags can help you manage, identify, organize, search for, and filter resources. Tagging can also be used to create new resource constructs for visibility or control (such as grouping together resources that make up a micro-service, application, or workload). Tagging is fundamental to providing enterprise-level visibility and control. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | AC-4, SC-7, SC-7 (21), SC-7 (4), SC-7 (5) | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. Not restricting access to ports to only authorized users, can lead to attacks against the availabil ity, integrity and confidentiality of systems. Security Group configurations should not allow ingress traffic from 0.0.0.0, but instead should specify trusted sources per port. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | IA-5 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentials making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | IA-2 (1) | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | CM-8, CM-8 (2) | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | CM-8, CM-8 (2) | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-in-vpc-only | AC-4, SC-7 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks | AC-4, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | AC-4, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-acl-prohibited | AU-9 | Simplify access management of S3 data by replacing bucket access control lists with IAM (and other) policies to regulate permissions to S3 buckets. Unless there is a need to control access to each object individually, disable ACLs and use policies to control ownership and access. Object ownership means the bucket owner owns all the objects in the bucket, even when uploaded by different AWS accounts, and allows for easy access management. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-default-lock-enabled | AU-9 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-level-public-access-prohibited | AC-4, AU-9, SC-7 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | AU-12, AU-2, AU-3 | Server access logging provides a mechanism to detect potential cybersecurity events, unauthorized access and suspicious activity. Each access log record provides details about a single access request and contains the requester, bucket name, request time, request action, response status, and an error code, if relevant. Server access logs are sent from a source bucket to a chosen target S3 bucket in the same AWS Region to ensure redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-read-prohibited | AC-3, AC-4, AC-6, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | AC-3, AC-4, AC-6, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-replication-enabled | CP-6, CP-6 (1) | Enabling S3 cross-region replication is crucial for ensuring data availability, durability, and compliance. It helps protect against data loss, regional outages, and provides a mechanism for disaster recovery. By replicating data to a different region, organizations can maintain business continuity and meet regulatory requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | AU-9, AU-9 (3), SC-28 (1) | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-ssl-requests-only | SC-8 (1) | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-tagged | CM-8, CM-8 (2) | Tagging S3 buckets is essential for effective resource management, cost allocation, and governance. Tags enable organizations to categorize buckets by purpose, owner, environment, or project, facilitating accurate cost tracking and billing. Proper tagging also supports automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | AU-9 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and applicati on failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanent ly, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encrypt ion-kms | AU-9, AU-9 (3), SC-28 (1) | Protecting objects in S3 using encryptio n at rest with KMS prevents unauthori zed access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | AU-11, AU-4 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | CP-9 | Performing data backups is critical to a disaster recovery plan. Data is vulnerable to hardware or software malfunctions or data corruption, cyberattacks, accidental deletion, calamities, and more. Ensuring that data is backed up will mitigate the forementioned risks. IMPORTANT NOTE: You must enable S3 Versioning on your S3 bucket to use AWS Backup for Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | AU-11, AU-4 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | SC-7, SC-7 (3), SC-7 (5) | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | CM-8, CM-8 (2) | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-config-prod-instance-count | CP-7, CP-7 (1) | Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architect ure. High availabil ity helps you to recover from security incidents. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | CM-8, CM-8 (2) | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-image-description | SA-5 | Requiring descriptions for SageMaker images enhances operational visibility and governance by providing essential metadata about image contents, purpose, and usage. Proper documentation through descriptions facilitates image management, enables teams to understand image functionality, supports compliance auditing, and reduces the risk of using inappropriate or outdated images in machine learning workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | SC-7, SC-7 (3) | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | SC-28, SC-7, SC-7 (3) | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | AU-6 (1), AU-6 (3), AU-6 (5), CA-7, CA-7 (4), IR-4 (1) | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | CM-8, CM-8 (2) | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | AC-3 | Portfolio sharing only within Organizations helps ensure that a portfolio isnt shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub recommends using ORGANIZATIONMEMBER ACCOUNT instead of ACCOUNT. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ses-malware-scanning-enabled | SI-8 | Malware scanning in SES is crucial for protecting email workflows from potential security threats. Without scanning, malicious attachments or spam could infiltrate your systems. Implementing malware scanning helps maintain email security and prevents potential infections. | Available only in US East (N. Virginia), US West (Oregon), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-message-delivery-notification-enabled | IR-6 (1) | Logging message delivery status helps provide better operational insight, such as, knowing whether a message was delivered to the Amazon SNS endpoint, identifying the response sent from the Amazon SNS endpoint to Amazon SNS, determining the message dwell time (the time between the publish timestamp and just before handing off to an Amazon SNS endpoint). | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | AC-3, AC-4 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-dlq-check | SI-10 | Dead letter queues are essential for robust message processing architectures as they provide a mechanism to isolate and examine messages that repeatedly fail processing. Without DLQ configuration, failed messages may be lost permanently or continue consuming processing resources through infinite retry loops. This control helps ensure message durability, enables debugging of processing failures, prevents resource exhaustion from problematic messages, and supports compliance requirements for data retention and audit trails in distributed systems. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | AC-3, AC-6 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | based application architectures. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | AC-3, AC-6 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | AC-3, AC-6 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | AU-12, AU-2, AU-3 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | CM-8, CM-8 (2) | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-resources-in-logically-air-gapped-vault | SC-7 (21) | Logical air-gapping is essential for protecting critical Storage Gateway data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical Storage Gateway volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-agreement-description | CA-3 | Requiring descriptions for Transfer Family agreements enhances operational visibility governance by ensuring each agreement is properly documented with its purpose, scope, business context. This documentation is essential for compliance auditing, troubleshooting data transfer issues, maintaining clear accountability for file transfer partnerships. Well-documented agreements also facilitate knowledge transfer between team members support regulatory requirements that mandate proper documentation of data sharing arrangements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-connector-logging-enabled | AU-12, AU-2, AU-3 | Enabling CloudWatch logging for AWS Transfer Family Connectors is essential for maintaining operational visibility, security monitoring, compliance requirements. Comprehensive logging enables organizations to track file transfer activities, monitor connector performance, detect anomalous behavior, maintain audit trails for regulatory compliance. Without proper logging, organizations lose critical visibility into data transfer operations, making it difficult to troubleshoot issues, investigate security incidents, or demonstrate compliance with data governance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | SC-13, SC-8, SC-8 (1) | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-last-backup-recovery-point-created | CP-6 (2), CP-9 | Regular recovery point creation is crucial for maintaining virtual machine data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of VM failures. Implementing regular backups provides a reliable mechanism for virtual machine protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-in-logically-air-gapped-vault | CP-6 (2), CP-9 | Regular recovery point creation is crucial for maintaining volume data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of volume failures. Implementing regular backups provides a reliable mechanism for volume protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-protected-by-backup-plan | CP-9 | Ensuring EC2 instances are included in a backup plan allows for recovery of instance data and applications in the event of loss or corruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-default-security-group-closed | AC-4, SC-7, SC-7 (21), SC-7 (4), SC-7 (5) | Default VPCs and any VPCs that are created come with a default security group. With some resources , default security group is automatic ally assigned if the resource is created without specifying a custom security group. Default security group outbound/inbound rule allows all traffic and this can increase opportunities for malicious activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | AC-4 | Having unused network Access Control Lists (ACLs) increases the risk of unauthorized access to VPC EC2 resources and should be removed once not needed any longer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-peering-dns-resolution-check | AC-4, SC-7, SC-7 (21), SC-7 (4) | VPC peering reduces network latency by using only internal addresses. It enhances network security by not exposing services to the public internet and reduces potential DNS based attacks which can compromise the confidentiality, integrity and availability of resources in the VPCs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-open-only-to-authorized-ports | AC-4, SC-7, SC-7 (21), SC-7 (4) | High risk ports are often exposed to the Internet and easily exploitable by attackers. Security groups provide stateful filtering of ingress and egress network traffic to AWS. Security group rules should follow the principal of least privileged access. Unrestricted access (IP address with a /0 suffix) increases the opportunity for malicious activity such as hacking, denial-of-service attacks, and loss of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | SC-7, SC-7 (3), SC-7 (5) | Security groups provide stateful filtering of ingress and egress network traffic to AWS resources. We recommend that no security group allow unrestricted ingress access to remote server administration ports, such as SSH to port 22 and RDP to port 3389, using either the TDP (6), UDP (17), or ALL (-1) protocols. Permitting public access to these ports increases resource attack surface and the risk of resource compromise. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| wafv2-rulegroup-not-empty | AC-4 | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | CM-8, CM-8 (2) | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-root-volume-encryption-enabled | SC-13, SC-28, SC-28 (1) | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | SC-13, SC-28, SC-28 (1) | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | CM-8, CM-8 (2) | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## FedRAMP Rev. 5 - Low Baseline

This AWS Config managed conformance pack provides a curated mapping between the Federal Risk and Authorization Management Program (FedRAMP) Revision 5 Low Baseline controls and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more FedRAMP controls. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** FEDRAMP_R5_LOW

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 306 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-internal-scheme-check | SC-7 | Internal scheme configuration for Application Load Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | This configuration helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requirements that mandate network segmentation and controlled access to application infrastructure. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-listener-tagged | CM-8 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibility and enable automated resource lifecycle management through tag-based policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | CM-8 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | SA-8 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-description | SA-5 | Requiring descriptions for AWS Amplify applications enhances operational visibility and governance by ensuring applications are properly documented. Descriptions provide essential context about application purpose, functionality, and ownership, which facilitates better resource management, troubleshooting, and compliance reporting. This practice supports organizational standards for resource documentation and helps teams quickly identify and understand deployed applications across the environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | AU-12, AU-2, AU-3 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | CM-8 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | CM-8 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-description | SA-5 | Requiring descriptions for AppConfig applications enhances operational visibility and governance by ensuring proper documentation of application purposes and configurations. Well-documented applications improve team collaboration, facilitate troubleshooting, support compliance auditing, and reduce the risk of misconfiguration or unintended changes to critical application settings. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | CM-8 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | CM-8 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | CM-2, CM-6 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-description | SA-5 | Requiring descriptions for AppConfig deployment strategies enhances operational visibility and governance by ensuring deployment approaches are properly documented. Well-documented deployment strategies facilitate team collaboration, reduce configuration errors, and support compliance requirements by providing clear context about how application configurations are rolled out. This documentation becomes critical during incident response, audits, and knowledge transfer activities. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-replicate-to-ssm | SA-5 | Replicating AppConfig deployment strategies to Systems Manager documents provides centralized configuration management, enhanced auditability, and improved operational visibility. This practice enables teams to maintain consistent deployment patterns across environments, facilitates compliance reporting by creating auditable records of deployment configurations, and supports disaster recovery scenarios by ensuring deployment strategies are preserved in a managed service with built-in versioning and access controls. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-description | SA-5 | Requiring descriptions for AppConfig environments enhances operational visibility and governance by ensuring proper documentation of configuration management resources. Well-documented environments facilitate troubleshooting, change management, and knowledge transfer among team members. This practice supports compliance requirements for maintaining adequate documentation of system components and helps prevent configuration drift by clearly identifying the purpose and scope of each environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | CM-8 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | CM-8 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-freeform-profile-config-storage | CM-2, CM-6 | Storing configuration data in approved AWS services ensures proper security controls, encryption, access management, and audit capabilities. AWS Secrets Manager provides automatic encryption, rotation capabilities, and fine-grained access controls for sensitive configuration data. AWS AppConfig hosted configuration store offers integrated security features and simplified management within the AppConfig service. Using unapproved storage locations may expose configuration data to security risks, lack proper encryption, or bypass organizational governance controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-hosted-configuration-version-description | SA-5 | Requiring descriptions for AppConfig hosted configuration versions enhances operational visibility and change management practices. Meaningful descriptions help teams understand the purpose and impact of configuration changes, facilitate troubleshooting during incidents, and maintain proper audit trails for compliance requirements. This practice reduces the risk of deploying unintended configurations and improves collaboration among development and operations teams by providing clear context for each configuration version. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-description | SA-5 | Requiring descriptions for AppIntegrations event integrations enhances operational visibility and maintainability by ensuring each integration is properly documented. Descriptions help teams understand the purpose, scope, and business context of integrations, which is critical for troubleshooting, change management, and knowledge transfer. Well-documented integrations reduce operational risk, improve incident response times, and support compliance requirements that mandate proper documentation of system components and data flows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | CM-8 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | CM-8 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | SC-7 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | CM-8 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | CM-8 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | SC-13 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | CM-6 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | CM-8 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | SC-13 | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | CM-6 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | CM-8 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | CM-8 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | CM-8 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | SC-7 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | SC-7 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | AU-12, AU-2, AU-3 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). |---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appstream-fleet-in-vpc | SC-7 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configura tion supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastru cture. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | SC-13 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | SC-13 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | SC-13 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | SI-4 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | AU-12, AU-2, AU-3 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-data-catalog-description | SA-5 | Requiring descriptions for Athena data catalogs enhances data governance by ensuring proper documentation of catalog purposes, contents, and usage guidelines. Well-documented catalogs improve data discoverability, facilitate compliance with data management policies, and enable teams to understand data sources and their intended use cases. This practice supports organizational data stewardship efforts and reduces the risk of data misuse or confusion in analytics workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-prepared-statement-description | SA-5 | Requiring descriptions for Athena prepared statements enhances query management, maintainability, and operational transparency. Documented prepared statements enable teams to understand query purposes, facilitate knowledge transfer, and support effective database governance. This practice reduces operational risks by ensuring that complex or frequently-used queries are properly documented for future reference and troubleshooting. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Europe (Milan), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-description | SA-5 | Requiring descriptions for Athena workgroups enhances operational visibility and governance by ensuring workgroups are properly documented with their intended purpose, usage patterns, and ownership information. Well-documented workgroups improve resource management, facilitate troubleshooting, support compliance auditing, and help teams understand the business context of query workloads. This practice is essential for maintaining organized data analytics environments and ensuring proper resource accountability in multi-team organizations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | CM-2, CM-6 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | SI-2 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | AU-12, AU-2, AU-3 | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-mysql-cluster-audit-logging | AU-12, AU-2, AU-3 | Audit logging is essential for maintaining database security and regulatory compliance by providing detailed records of all database activities, including user connections, queries, and administrative actions. This capability enables security teams to detect unauthorized access attempts, investigate potential security incidents, and meet compliance requirements for data governance. Without audit logging, organizations lack visibility into database operations and cannot effectively monitor for suspicious activities or demonstrate compliance with regulatory frameworks that require | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

|---|---|---|---|
| | | vulnerabilities or operational issues. | |
| cloudfront-default-root-object-configured | CM-6, SC-7 | Without a default root object configured, requests to the root URL of a CloudFront distribution may expose directory listings or other unintended content. Configuring a default root object ensures that users receive a specific file when accessing the distribution's root URL, reducing the risk of information disclosure and maintaining better control over content delivery. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | SC-13 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | AC-3, CM-6, SC-7 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | AU-12, AU-2, AU-3 | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-all-write-s3-data-event-check | AU-12, AU-2, AU-3 | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudtrail-s3-bucket-access-logging | AU-12, AU-2, AU-3 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudtrail-security-trail-enabled | AU-12, AU-3 | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | AU-5, CA-7, CA-7 (4), CM-11, CM-6 | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. |---|---|---|---|
| | | ooting, and forensic analysis purposes. | |
| cloudwatch-metric-stream-tagged | CM-8 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-cloud-watch-logs-enabled | AU-12, AU-3 | Sending CloudTrail logs to CloudWatch Logs will facilitate real-time and historic activity logging based on user, API, resource, and IP address, and provides opportunity to establish alarms and notifications for anomalous or sensitivity account activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | AU-12, AU-2, AU-3 | CloudTrail provides critical visibility into account activity by recording AWS API calls and related events. Without CloudTrail enabled, organizations lose the ability to conduct security analysis, resource change tracking, and compliance auditing. This detective control identifies accounts lacking proper logging capabilit ies, which creates security blind spots that prevent effective incident investiga tion, complianc e verification, and detection of unauthorized activitie s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | AU-9 | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-log-file-validation-enabled | AU-9 | Enabling log file validation ensures the integrity of CloudTrail log files by digitally signing log files using cryptographic hash functions verifying log data has not been tampered with or modified providing a mechanism to investigate the event, trace its origin, and understand the impact supportin g effective incident response. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| codebuild-report-group-encrypted-at-rest | SC-13 | Data at rest refers to data thats stored in persistent, non-volat ile storage for any duration. Encrypting data at rest helps you protect its confident iality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | CM-8 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-auto-rollback-enabled | CP-10, CP-9 | Auto rollback configuration in CodeDeploy deployment groups provides critical protection against failed deployments by automatically reverting to the previous working version when deployment failures or alarm thresholds are triggered. This capability minimizes application downtime, reduces the impact of problematic deployments, and ensures service availability. Without auto rollback enabled, failed deployments may require manual intervention to restore service, potentially leading to extended outages and degraded user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | SI-2 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | AC-3, IA-2 | Preventing unauthenticated access to Cognito Identity Pools is critical for maintaining security boundaries and implementing proper access controls. Allowing unauthenticated identities can expose AWS resources to unauthorized users, potentially leading to data breaches, resource abuse, or compliance violations. By monitoring and detecting Identity Pools with unauthenticated access enabled, organizations can ensure that all users are properly authenticated before receiving temporary AWS credentials, supporting defense-in-depth security strategies and regulatory compliance requirements. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-advanced-security-enabled | AC-3 | Advanced security features in Cognito user pools are essential for protectin g against unauthori zed access and potential threats. Without these features, user accounts may be more vulnerable to attacks such as credential stuffing or brute force attempts. Enabling advanced security strengthens overall user authentic ation and access control. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | CM-8 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | AU-12, AU-2, AU-3 | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| custom-eventbus-policy-attached | AC-3 | Attaching a resource policy helps control access to custom EventBus resources , enforcing least privilege and reducing the risk of unauthorized access. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cw-loggroup-retention-period-check | AU-11 | Configuring retention periods for Amazon CloudWatch log groups ensures that data is kept for the required duration, to meet organizational compliance requirements, and allows the review and investigation of suspicious activities. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | SC-13 | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |
| datasync-task-logging-enabled | AU-12, AU-2, AU-3 | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | SC-13 | HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. You should only allow encrypted connections over TLS to access DAX clusters. However, encrypting data in transit can affect performance. You should test your application with encryption turned on to understand the performance profile and the impact of TLS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| db-instance-backup-enabled | CP-9 | Failure to backup RDS instances can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuri ng backups to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | CM-8 | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | accountability across database migration projects. | |
| dms-mongo-db-authentication-enabled | AC-3, IA-2, IA-5 (1) | Enabling authentication for MongoDB endpoints is critical for maintaining data security during migrations. Without proper authentication, unauthorized access to sensitive data could occur. Implementing password-based authentication helps protect MongoDB data stores from unauthorized access and potential data breaches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-neptune-iam-authorization-enabled | AC-3 | IAM authentication for Neptune endpoints provides robust, scalable access control. Without IAM authentication, managing access to Neptune databases during migrations could be less secure and more complex. Implementing IAM authorization ensures fine-grained control over who can access Neptune data through DMS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-redis-tls-enabled | SC-13 | TLS provides end-to-end security when data is sent between applications or databases over the internet. When you configure SSL encryption for your DMS endpoint, it enables encrypted communication between the source and target databases during the migration process. This helps prevent eavesdropping and interception of sensitive data by malicious actors. Without SSL encryption, sensitive data may be accessed, resulting in data breaches, data loss, or other security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-sourcedb-logging | AU-12, AU-2, AU-3 | Proper logging of DMS replication tasks is crucial for maintaining operational visibility and ensuring data integrity. Without adequate logging, issues in the replication process might go undetected, potentially leading to data inconsistencies. Configuring appropriate logging supports efficient troubleshooting and monitoring of migration processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-tagged | CM-8 | Proper tagging of DMS replication tasks enables effective resource management, cost allocation, and governance. Tags facilitate tracking of migration projects, identifying resource ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into their migration activities and cannot effectively manage costs or apply security policies across their DMS infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | SC-13 | Encryption in transit protects sensitive data as it moves between DocumentDB clients and clusters, preventing unauthorized interception and eavesdropping on database communications. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transmission. Enabling TLS encryption ensures that database credentials, queries, and results remain confidential and maintain integrity during network transmission. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| dynamodb-in-backup-plan | CP-9 | Failure to backup DynamoDB tables can result in a loss of mission critical data in the event of a failure or security incident. Enabling and properly configuring AWS Backup to match the organization's backup requirements is crucial to restore data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-pitr-enabled | CP-9 | Implement point in time recovery risk mitigation measures to ensure your data is protected and can be restored to a specific point in the past whenever needed. This helps increase resiliency and availability of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

|---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | AU-12, AU-2, AU-3 | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | CM-8 | Proper tagging of VPN connections enables effective resource management, cost allocation, governance oversight. Tags facilitate automated operations, security policies, compliance reporting by providing metadata that identifies resource ownership, purpose, environment, other critical attributes. Consistent tagging practices improve operational visibility support organizational policies for resource lifecycle management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | CM-8 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | CM-6 | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | CM-8 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | SC-7 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | CP-9 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| efs-file-system-tagged | CM-8 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| efs-in-backup-plan | CP-9 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | AC-3, SC-7 | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-resources-in-logically-air-gapped-vault | SC-7 | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| efs-resources-protected-by-backup-plan | CP-9 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| eip-attached | SC-7 | A disassociated Elastic IP (EIP) remains allocated to your account until you explicitly release it. A small hourly charge is incurred for Elastic IP addresses that are not associated with a running EC2 instance. If you no longer need an Elastic IP address, it is recommended that you release it. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | CM-8 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operation al visibility. Tags enable organizat ions to categoriz e track add-ons by environment, owner, project, or cost center, facilitat ing accurate billing resource governanc e. Consistent tagging practices support automated management workflows, security policies, complianc e reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernete s infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | AU-12, AU-2, AU-3 | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | SC-12, SC-13 | When you encrypt secrets, you can use AWS Key Management Service (AWS KMS) keys to provide envelope encryption of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryption for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applications by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | CP-9 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-redis-cluster-automatic-backup-check | CP-9 | Enabling backups ensures that data is protected against accidental deletion, data corruption, and in the case of a system failure, you can restore your cluster from a backup, minimizin g downtime and ensuring business continuity. Point-in-time backups can restore your cluster to a specific point in time. Backups can be used for testing and development purposes, where a copy of the productio n cluster can be replicated for testing new features, debugging, or other development activitie s without impacting the live environment. | Available in all commercial Regions except Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-description | SA-5 | Application descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand application purposes, enables effective resource governance, assists in troubleshooting and maintenance activities, and ensures accountability in multi-team environments. Well-documented applications also support audit processes and help maintain organizational knowledge as team members change over time. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-version-description | SA-5 | Application version descriptions provide essential documentation for tracking changes, understanding deployment history, and maintaining operational visibility. Proper documentation enables teams to quickly identify the purpose and contents of specific application versions, facilitates troubleshooting and rollback procedures, and supports compliance requirements for change management. Without descriptions, organizations lose critical context about application deployments, making it difficult to manage the application lifecycle effectively and increasing the risk of deploying incorrect or outdated versions. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-environment-description | SA-5 | Environment descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand the purpose and context of each environment, reduces troubleshooting time, and ensures accountability in multi-team environments. This practice is particularly important for maintaining clear separation between development, staging, and production environments while supporting audit trails and change management processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | CA-7, SI-4 | Enhanced health reporting in Elastic Beanstalk provides deeper visibility into application health status beyond basic instance health checks. This capability monitors additional metrics including CPU utilization, application latency, and request rates, enabling more effective troubleshooting and faster incident response. Without enhanced health reporting, organizations may experience delayed detection of performance degradation, potentially resulting in extended service disruptions and negative impact on application availability. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | SC-13 | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | SC-7 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | CM-8 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-master-no-public-ip | SC-7 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-security-configuration-encryption-rest | SC-12, SC-13 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | SC-13 | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data processing workloads. | |
| encrypted-volumes | SC-13 | Encrypting data at rest on EBS volumes facilitates protectio n of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-launch-description | SA-5 | Requiring descriptions for Evidently launches enhances operational visibility and governance by ensuring proper documentation of feature experiments and rollouts. Descriptive metadata helps teams understand the purpose and context of launches, facilitates troubleshooting and audit processes, and supports effective collaboration across development and operations teams. This practice is essential for maintaining organized experimentation workflows and meeting documentation requirements for compliance frameworks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-description | SA-5 | Requiring descriptions for CloudWatch Evidently projects enhances operational visibility and governance by ensuring proper documentation of project purposes and objectives. Well-documented projects facilitate team collaboration, simplify project management, enable better resource tracking, and support compliance requirements for maintaining clear audit trails of experimentation activities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-description | SA-5 | Requiring descriptions for CloudWatch Evidently segments enhances operational visibility governance by ensuring proper documentation of audience segmentation logic. Well-documented segments improve team collaboration, facilitate troubleshooting of feature flag behaviors, support compliance requirements for change management audit trails. Clear segment descriptions help prevent misconfigurations enable more effective monitoring of experimental features across different user populations. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-tagged | CM-8 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentat ion. Proper tagging enables efficient resource managemen t, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | AU-12, AU-2 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | CM-8 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-entity-type-tagged | CM-8 | Proper tagging of Fraud Detector entity types is essential for maintaining operational visibilit y and control. Tags facilitate effective resource managemen t, cost tracking, and access control implementation. Without structured tagging, organizat ions risk losing oversight of their fraud detection infrastructure and associated resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-label-tagged | CM-8 | Tagging Fraud Detector labels is crucial for maintaining clear visibility and control over fraud detection configurations. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and analyze their fraud detection labels. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-outcome-tagged | CM-8 | Tagging Fraud Detector outcomes is essential for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their fraud detection outcomes and associated analysis capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-variable-tagged | CM-8 | Proper tagging of Fraud Detector variables is crucial for maintaining clear visibility and control over fraud detection configurations. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may face challenges in managing and analyzing their fraud detection variables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| fsx-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | CM-8 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-resources-protected-by-backup-plan | CP-9 | Failure to backup Amazon FSx file systems can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | AU-12, AU-2, AU-3 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | CM-8 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | CM-8 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | AU-12, AU-2, AU-3 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | SC-13 | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | SI-4 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | CA-7, SI-4 | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | visibility in containerized environments meeting compliance requirements for runtime threat detection. | |
| guardduty-eks-protection-audit-enabled | AU-6, CA-7, SI-4 | EKS Audit Log Monitoring is crucial for maintaining security visibility in Kubernetes environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilities for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | CA-7, SI-4 | Runtime monitoring is essential for detecting and responding to security threats in containerized environments. Without runtime monitoring, organizations may be unable to detect container-level security incidents in real-time. Implementing automated runtime monitoring enhances container security posture. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | IR-4, SI-4 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| guardduty-lambda-protection-enabled | CA-7, SI-4, SI-5 | Lambda Protection is crucial for maintaining security visibility in serverless architectures. Without this feature, organizations may miss potential security threats targeting their Lambda functions. Enabling Lambda Protection provides enhanced security monitoring for serverless workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | CA-7, SI-3, SI-4 | Malware Protection is essential for maintaining a strong security posture against malicious software. Without this feature, organizations may be vulnerable to undetected malware threats. Implementing Malware Protection enhances threat detection capabilities across AWS resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| guardduty-rds-protection-enabled | CA-7, SI-4 | RDS Protection is crucial for maintaining database security and detecting potential threats. Without this feature, organizations may miss security incidents targeting their database instances. Enabling RDS Protection provides enhanced security monitoring for database environments. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | CA-7, SI-4 | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | CA-7, SI-4 | S3 Protection is essential for maintaining security visibility over storage resources. Without this feature, organizations may miss potential security threats targeting their S3 buckets. Enabling S3 Protection enhances threat detection capabilities for storage environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-group-has-users-check | AC-3 | AWS IAM user groups that do not contain any users adds unnecessary operational complexity, increases oversight and could lead to unintentional risk. Ensuring that all user groups have user accounts simplifies management and oversight and reduces risk. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | CM-8 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | AC-2, IA-2, IA-5, IA-5 (1) | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | AC-3, CM-5 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | AC-3, CM-5 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | CM-8 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | SC-12 | Expired SSL/TLS server certificates left in IAM can be inadvertently associated with resources, causing failed or insecure connections and weakening trust in the certificate chain. Promptly removing expired certificates reduces the risk of outages and of clients negotiating connections with invalid credentials, and keeps the certificate inventory accurate. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | CM-8 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-no-policies-check | AC-3, CM-5 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-ssh | CM-7, SC-7 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | RA-5 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | RA-5 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | RA-5 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | RA-5 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| internet-gateway-authorized-vpc-only | SC-7 | This control provides a mechanism that forces attention on which VPC(s) should be allowed to access the public internet. This control will require the appropriate VPC(s) to be identified and labeled as approved for internet accesses through use of an IGW. Failure to identify and validate the list of authorized VPC's could cause unintended access to AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | CM-8 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | CM-8 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | CM-8 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iotsitewise-gateway-tagged | CM-8 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | CM-8 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | CM-8 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industrial IoT initiatives. Without proper tagging, organizations may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | CM-8 | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | IA-5, SC-13 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | CM-8 | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | AC-3, SI-4 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | SC-13 | Server-side encryption is a feature in Amazon Data Firehose delivery streams that automatically encrypts data before its at rest by using a key created in AWS Key Management Service (AWS KMS). Data is encrypted before its written to the Data Firehose stream storage layer, and decrypted after its retrieved from storage. This allows you to comply with regulatory requirements and enhance the security of your data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| kinesis-stream-backup-retention-check | SI-12 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-key-policy-no-public-access | AC-3, IA-7, SC-12 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | CM-8 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | CA-7, SI-4 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | CM-8 | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-certificate-tagged | CM-8 | Tagging Lightsail certificates enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking certificate ownership, purpose, and lifecycle management. Consistent tagging practices improve operational visibility, facilitate automated management tasks, and support compliance requirements by ensuring all SSL/TLS certificates can be properly identified and categorized within the infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-disk-tagged | CM-8 | Proper tagging of Lightsail disks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for asset identification. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, and face challenges in implementing automated management workflows. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | IA-2 (1), IA-2 (2) | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | IA-2, IA-5 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | SC-7 | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-cluster-tagged | CM-8 | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | AU-12, AU-2, AU-3 | Enabling logging for an Amazon MSK connector captures operational and error events needed to detect anomalous behavior, troubleshoot failures, and support security investigations. Without connector logs, malicious or erroneous activity can go unnoticed and forensic analysis is limited. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-enhanced-monitoring-enabled | CA-7, SI-4 | Enhanced monitoring is crucial for maintaining operational visibility and performance of Kafka clusters. Without detailed monitoring, organizations may miss critical performance issues or capacity problems. Implementing enhanced monitoring supports better cluster management and troubleshooting. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | AC-3, IA-2, IA-8 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | AU-12, AU-2, AU-3 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-backup-retention-check | CP-9 | Backups help to recover more quickly from a security incident and strengthen the resilience of the systems. Automating backups for Amazon Neptune DB clusters, enables to restore systems to a point in time, and minimize downtime and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-multi-az-enabled | SC-7 | By deploying a AWS Network Firewall firewall across multiple AZs, traffic can be balanced and shifted among AZs, which helps in designing highly available solutions. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-rule-group-associated | SC-7 | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | SC-7 | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | CM-5, CM-6, SC-7 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewalls subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | SC-7 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | CM-8 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | AU-12, AU-2, AU-3 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | CM-8 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | SC-7 | Restricting access to the IGW enhances the security of EC2 instances by protecting sensitive data and reduces the potential for data breaches or unauthorized activities. Restricting access to the IGW aligns with the principle of least privilege and allows for implementation of network segmentation and isolation strategies by controlling outbound connections creating communication boundaries between different parts of network infrastructure reducing the occurrence of lateral movement of threats, limits the impact of potential security incidents, and enhances overall network security and resilience. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | CP-10 | Configuring at least three dedicated primary (master) nodes for an Amazon OpenSearch Service domain provides quorum for cluster management and prevents split-bra in conditions during node failures. This improves the stability and availability of the domain and reduces the risk of cluster-wide outages that disrupt logging and search workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | AU-12, AU-2, AU-3 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| rds-db-security-group-not-allowed | SC-7 | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. This includes blocking traffic to and from 0.0.0.0/0. | Available only in US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | CM-8 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-subnet-igw-check | SC-7 | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-in-backup-plan | CP-9 | Failure to backup RDS instances can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuri ng backups to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | SC-13 | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | SC-13 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | CM-8 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | AU-12, AU-2, AU-3 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | SC-13 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | SC-13 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-resources-protected-by-backup-plan | CP-9 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | SC-13 | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | AU-12, AU-2, AU-3 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-backup-en abled | CP-9 | Snapshots can be used for data recovery or copied to other regions for the creation of new clusters with existing data. Snapshots play an important role in a disaster recovery and data retention requireme nts, allowing for the survival of an altered or terminated cluster, or for recovery due to security incidents. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | CP-2 | Enabling Multi-AZ deployment for an Amazon Redshift cluster maintains a standby in a second Availability Zone and fails over automatically if an AZ becomes impaired. This improves the availability and resilience of the data warehouse and reduces the risk of data unavailability during infrastructure failures. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | CM-2, CM-6 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | AU-12, AU-2, AU-3 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | SC-13 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | SC-7 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | SC-7 | If enhanced VPC routing is disabled for an Amazon Redshift Serverless workgroup, Amazon Redshift routes traffic through the internet, including traffic to other services within the AWS network. If you enable enhanced VPC routing for a workgroup, Amazon Redshift forces all COPY and UNLOAD traffic between your cluster and your data repositories through your virtual private cloud (VPC) based on the Amazon VPC service. With enhanced VPC routing, you can use standard VPC features to control the flow of data between your Amazon Redshift cluster and other resources. This includes features such as VPC security groups and endpoint | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | policies, network access control lists (ACLs), and Domain Name System (DNS) servers. You can also use VPC flow logs to monitor COPY and UNLOAD traffic. | |
| redshift-unrestricted-port-access | SC-7 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implement ing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | SC-7 | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. Not restricting access to ports to only authorized users, can lead to attacks against the availabil ity, integrity and confidentiality of systems. Security Group configurations should not allow ingress traffic from 0.0.0.0, but instead should specify trusted sources per port. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | IA-5 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentials making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | IA-2 (1) | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | CM-8 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | CM-8 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-in-vpc-only | SC-7 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks | AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-acl-prohibited | AU-9 | Simplify access management of S3 data by replacing bucket access control lists with IAM (and other) policies to regulate permissions to S3 buckets. Unless there is a need to control access to each object individually, disable ACLs and use policies to control ownership and access. Object ownership means the bucket owner owns all the objects in the bucket, even when uploaded by different AWS accounts, and allows for easy access management. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-default-lock-enabled | AU-9 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-level-public-access-prohibited | AU-9, SC-7 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | AU-12, AU-2, AU-3 | Server access logging provides a mechanism to detect potential cybersecurity events, unauthorized access and suspicious activity. Each access log record provides details about a single access request and contains the requester, bucket name, request time, request action, response status, and an error code, if relevant. Server access logs are sent from a source bucket to a chosen target S3 bucket in the same AWS Region to ensure redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-public-read-prohibited | AC-3, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | AC-3, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | AU-9 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-tagged | CM-8 | Tagging S3 buckets is essential for effective resource managemen t, cost allocation, and governance. Tags enable organizat ions to categorize buckets by purpose, owner, environment, or project, facilitat ing accurate cost tracking and billing. Proper tagging also supports automated resource managemen t, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | AU-9 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and applicati on failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanent ly, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encrypt ion-kms | AU-9 | Protecting objects in S3 using encryptio n at rest with KMS prevents unauthori zed access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | AU-11, AU-4 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | CP-9 | Performing data backups is critical to a disaster recovery plan. Data is vulnerable to hardware or software malfunctions or data corruption, cyberattacks, accidental deletion, calamities, and more. Ensuring that data is backed up will mitigate the forementioned risks. IMPORTANT NOTE: You must enable S3 Versioning on your S3 bucket to use AWS Backup for Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | AU-11, AU-4 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | SC-7 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | CM-8 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | CM-8 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-image-description | SA-5 | Requiring descriptions for SageMaker images enhances operational visibility and governance by providing essential metadata about image contents, purpose, and usage. Proper documentation through descriptions facilitates image management, enables teams to understand image functionality, supports compliance auditing, and reduces the risk of using inappropriate or outdated images in machine learning workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | SC-7 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | SC-7 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | CA-7, CA-7 (4) | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | CM-8 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | AC-3 | Portfolio sharing only within Organizations helps ensure that a portfolio isnt shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub recommends using ORGANIZATIONMEMBER ACCOUNT instead of ACCOUNT. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | AC-3 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | AC-3 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | based application architectures. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | AC-3 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | AC-3 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | AU-12, AU-2, AU-3 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | CM-8 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-agreement-description | CA-3 | Requiring descriptions for Transfer Family agreements enhances operational visibility governance by ensuring each agreement is properly documented with its purpose, scope, business context. This documentation is essential for compliance auditing, troubleshooting data transfer issues, maintaining clear accountability for file transfer partnerships. Well-documented agreements also facilitate knowledge transfer between team members support regulatory requirements that mandate proper documentation of data sharing arrangements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-connector-logging-enabled | AU-12, AU-2, AU-3 | Enabling CloudWatch logging for AWS Transfer Family Connectors is essential for maintaining operational visibility, security monitoring, compliance requirements. Comprehensive logging enables organizations to track file transfer activities, monitor connector performance, detect anomalous behavior, maintain audit trails for regulatory compliance. Without proper logging, organizations lose critical visibility into data transfer operations, making it difficult to troubleshoot issues, investigate security incidents, or demonstrate compliance with data governance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | SC-13 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining virtual machine data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of VM failures. Implementing regular backups provides a reliable mechanism for virtual machine protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-in-logically-air-gapped-vault | CP-9 | Regular recovery point creation is crucial for maintaining volume data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of volume failures. Implementing regular backups provides a reliable mechanism for volume protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-protected-by-backup-plan | CP-9 | Ensuring EC2 instances are included in a backup plan allows for recovery of instance data and applications in the event of loss or corruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-default-security-group-closed | SC-7 | Default VPCs and any VPCs that are created come with a default security group. With some resources , default security group is automatic ally assigned if the resource is created without specifying a custom security group. Default security group outbound/inbound rule allows all traffic and this can increase opportunities for malicious activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-peering-dns-resolution-check | SC-7 | VPC peering reduces network latency by using only internal addresses. It enhances network security by not exposing services to the public internet and reduces potential DNS based attacks which can compromise the confidentiality, integrity and availability of resources in the VPCs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-open-only-to-authorized-ports | SC-7 | High risk ports are often exposed to the Internet and easily exploitable by attackers. Security groups provide stateful filtering of ingress and egress network traffic to AWS. Security group rules should follow the principal of least privileged access. Unrestricted access (IP address with a /0 suffix) increases the opportunity for malicious activity such as hacking, denial-of-service attacks, and loss of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | SC-7 | Controlling inbound access to sensitive ports is crucial for maintaining network security. Unrestricted access to ports like SSH (22) or RDP (3389) could lead to unauthorized system access and potential breaches. Implementing strict port access controls helps prevent unauthorized access to resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | CM-8 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-root-volume-encryption-enabled | SC-13 | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | SC-13 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | CM-8 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## FedRAMP Rev. 5 - Moderate Baseline

This AWS Config managed conformance pack provides a curated mapping between the Federal Risk and Authorization Management Program (FedRAMP) Revision 5 Moderate Baseline controls and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more FedRAMP controls. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** FEDRAMP_R5_MODERATE

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 368 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-http-to-https-redirection-check | SC-8 (1) | By forcing redirecti on from HTTP to the secure HTTPs protocol, data is encrypted in transit in both directions: going to and coming from the origin server to maintain confident iality and prevent malicious actors from unauthorized access to sensitive data such as user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-internal-scheme-check | SC-7, SC-7 (5) | Internal scheme configuration for Application Load | Available in all commercial Regions except Asia Pacific |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. This configura tion helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requireme nts that mandate network segmentat ion and controlled | (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | access to application infrastructure. | |
| alb-listener-tagged | CM-8 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibility and enable automated resource lifecycle management through tag-based policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | CM-8 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | SA-15, SA-8 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-description | SA-5 | Requiring descriptions for AWS Amplify applications enhances operational visibility and governance by ensuring applications are properly documented. Descriptions provide essential context about application purpose, functionality, and ownership, which facilitates better resource management, troubleshooting, and compliance reporting. This practice supports organizational standards for resource documentation and helps teams quickly identify and understand deployed applications across the environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | SC-28 (1) | When caching is enabled, Amazon API Gateway service caches responses from API endpoint, reduces the number of calls made to an API endpoint and improves the latency of requests to the API. In addition, encrypted REST API caches protect data from unauthorized access. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | AU-12, AU-2, AU-3 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | CM-8 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | CM-8 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-description | SA-5 | Requiring descriptions for AppConfig applications enhances operational visibility and governance by ensuring proper documentation of application purposes and configurations. Well-documented applications improve team collaboration, facilitate troubleshooting, support compliance auditing, and reduce the risk of misconfiguration or unintended changes to critical application settings. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | CM-8 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | CM-8 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | CM-2, CM-6 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-description | SA-5 | Requiring descriptions for AppConfig deployment strategies enhances operational visibility and governance by ensuring deployment approaches are properly documented. Well-documented deployment strategies facilitate team collaboration, reduce configuration errors, and support compliance requirements by providing clear context about how application configurations are rolled out. This documentation becomes critical during incident response, audits, and knowledge transfer activities. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-replicate-to-ssm | SA-5 | Replicating AppConfig deployment strategies to Systems Manager documents provides centralized configuration management, enhanced auditability, and improved operational visibility. This practice enables teams to maintain consistent deployment patterns across environments, facilitates compliance reporting by creating auditable records of deployment configurations, and supports disaster recovery scenarios by ensuring deployment strategies are preserved in a managed service with built-in versioning and access controls. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-description | SA-5 | Requiring descriptions for AppConfig environments enhances operational visibility and governance by ensuring proper documentation of configuration management resources. Well-documented environments facilitate troubleshooting, change management, and knowledge transfer among team members. This practice supports compliance requirements for maintaining adequate documentation of system components and helps prevent configuration drift by clearly identifying the purpose and scope of each environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | CM-8 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | CM-8 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-freeform-profile-config-storage | CM-2, CM-3, CM-6 | Storing configuration data in approved AWS services ensures proper security controls, encryption, access management, and audit capabilities. AWS Secrets Manager provides automatic encryption, rotation capabilities, and fine-grained access controls for sensitive configuration data. AWS AppConfig hosted configuration store offers integrated security features and simplified management within the AppConfig service. Using unapproved storage locations may expose configuration data to security risks, lack proper encryption, or bypass organizational governance controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-hosted-configuration-version-description | SA-5 | Requiring descriptions for AppConfig hosted configuration versions enhances operational visibility and change management practices. Meaningful descriptions help teams understand the purpose and impact of configuration changes, facilitate troubleshooting during incidents, and maintain proper audit trails for compliance requirements. This practice reduces the risk of deploying unintended configurations and improves collaboration among development and operations teams by providing clear context for each configuration version. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-description | SA-5 | Requiring descriptions for AppIntegrations event integrations enhances operational visibility and maintainability by ensuring each integration is properly documented. Descriptions help teams understand the purpose, scope, and business context of integrations, which is critical for troubleshooting, change management, and knowledge transfer. Well-documented integrations reduce operational risk, improve incident response times, and support compliance requirements that mandate proper documentation of system components and data flows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | CM-8 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | CM-8 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | SC-7, SC-7 (5) | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | CM-8 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | CM-8 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | SC-13, SC-8, SC-8 (1) | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | CM-6 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | CM-8 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | SC-13, SC-8, SC-8 (1) | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | CM-6 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | CM-8 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | CM-8 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | CM-8 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | AC-4, SC-7, SC-7 (5) | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | SC-7, SC-7 (3) | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | AU-12, AU-2, AU-3 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appstream-fleet-in-vpc | AC-4, SC-7, SC-7 (4) | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configuration supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | SC-13, SC-28, SC-28 (1) | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | SC-13, SC-8, SC-8 (1) | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | SC-13, SC-28, SC-28 (1) | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | SI-4, SI-4 (2) | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | AU-12, AU-2, AU-3 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| athena-data-catalog-description | SA-5 | Requiring descriptions for Athena data catalogs enhances data governance by ensuring proper documentation of catalog purposes, contents, and usage guidelines. Well-documented catalogs improve data discoverability, facilitate compliance with data management policies, and enable teams to understand data sources and their intended use cases. This practice supports organizational data stewardship efforts and reduces the risk of data misuse or confusion in analytics workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-prepared-statement-description | SA-5 | Requiring descriptions for Athena prepared statements enhances query management, maintainability, and operational transparency. Documented prepared statements enable teams to understand query purposes, facilitate knowledge transfer, and support effective database governance. This practice reduces operational risks by ensuring that complex or frequently-used queries are properly documented for future reference and troubleshooting. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Europe (Milan), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-description | SA-5 | Requiring descriptions for Athena workgroups enhances operational visibility and governance by ensuring workgroups are properly documented with their intended purpose, usage patterns, and ownership information. Well-documented workgroups improve resource management, facilitate troubleshooting, support compliance auditing, and help teams understand the business context of query workloads. This practice is essential for maintaining organized data analytics environments and ensuring proper resource accountability in multi-team organizations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | SC-28, SC-28 (1) | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | CM-2, CM-6 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | SI-2 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | AU-12, AU-2, AU-3, AU-3 (1) | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| aurora-last-backup-recovery-point-created | CP-10 (2) | Maintaining backup recovery points enables efficient data restoration and business continuity for Aurora databases in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). | batch-compute-environment-enabled | CM-2, CM-6, CP-2 | Enabled Batch compute environments are essential for maintaining operational continuity and ensuring that batch processing workloads can execute as expected. Disabled compute environments prevent job queues from launching instances and processing jobs, which can lead to application failures, delayed data processing, and potential business impact. Monitoring the enabled state helps detect unintended configuration changes that could disrupt critical batch processing operations and ensures that compute resources remain available for scheduled and on-demand workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | CM-2, CM-3, CM-6 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | vulnerabilities or operational issues. | |
| cloudformation-stack-notification-check | CM-8 (3) | Sending event notifications to an SNS topic allows you to perform real time monitoring of your CloudFormation stacks and proactively manage the provisioning and update process of AWS resources . CloudFormation stacks event notifications help identify unauthorized actions and ensure that AWS resources meet corporate standards and compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Spain), Israel (Tel Aviv), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| cloudfront-custom-ssl-certificate | SC-8 (1) | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-default-root-object-configured | CM-6, SC-7 | Without a default root object configured, requests to the root URL of a CloudFront distribution may expose directory listings or other unintended content. Configuring a default root object ensures that users receive a specific file when accessing the distribution's root URL, reducing the risk of information disclosure and maintaining better control over content delivery. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | SC-13, SC-8, SC-8 (1) | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | AC-3, AC-4, CM-6, SC-7 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-traffic-to-origin-encrypted | SC-8 (1) | Encrypting traffic between CloudFron t distribution and its custom origin will ensure that the environme nt is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-viewer-policy-https | SC-8 (1) | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | AU-12, AU-2, AU-3, AU-3 (1) | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-all-write-s3-data-event-check | AU-12, AU-2, AU-3, AU-3 (1) | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudtrail-s3-bucket-access-logging | AU-12, AU-2, AU-3, AU-3 (1) | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudtrail-security-trail-enabled | AU-12, AU-3 | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | AU-5, AU-7 (1), CA-7, CA-7 (4), CM-11, CM-6, SI-4 (5) | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudwatch-alarm-action-enabled-check | SI-4 (5) | CloudWatch Alarms trigger automated notifications and actions when reaching pre-defined thresholds. Disabling CloudWatch alarms will stop continuous monitoring, and delay responses to events affecting critical applications or functions. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-log-group-encrypted | AU-9, SC-28 (1) | Although the CloudWatch Log groups are encrypted by default using SSE (Server Side encryption), encrypting Amazon CloudWatch logs with KMS keys enhances the security and protection of sensitive log data. Encrypting logs at rest ensures if unauthorized individuals gain access to the underlying storage infrastructure, they will not be able to read the log data without the encryption key. Encrypting CloudWatch logs provides an additional layer of defense and assists with preventing unauthorized modification or tampering of log data, ensuring the integrity and reliability of the logs for auditing, troublesh | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | ooting, and forensic analysis purposes. | |
| cloudwatch-metric-stream-tagged | CM-8 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-cloud-watch-logs-enabled | AU-12, AU-3 | Sending CloudTrail logs to CloudWatch Logs will facilitate real-time and historic activity logging based on user, API, resource, and IP address, and provides opportunity to establish alarms and notifications for anomalous or sensitivity account activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-enabled | AC-6 (9), AU-12, AU-2, AU-3 | Enabling CloudTrail provides essential visibility into your AWS environment by recording API activity and changes, aiding in security monitoring, compliance audits, and troubleshooting incidents. It enhances accountability, enables rapid incident response, and facilitates thorough forensic analysis of events within your cloud infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | AU-9, SC-28, SC-28 (1) | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-log-file-validation-enabled | AU-9 | Enabling log file validation ensures the integrity of CloudTrail log files by digitally signing log files using cryptographic hash functions verifying log data has not been tampered with or modified providing a mechanism to investigate the event, trace its origin, and understand the impact supportin g effective incident response. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| codebuild-report-group-encrypted-at-rest | SC-13, SC-28, SC-28 (1) | Data at rest refers to data thats stored in persistent, non-volat ile storage for any duration. Encrypting data at rest helps you protect its confident iality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | CM-8 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-auto-rollback-monitor-enabled | CM-2 (3), CM-3 | Auto rollback and monitoring helps ensure service continuity by automatically reverting failed deployments, reducing potential downtime and business impact. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-auto-rollback-enabled | CP-10, CP-9 | Auto rollback configuration in CodeDeploy deployment groups provides critical protection against failed deployments by automatically reverting to the previous working version when deployment failures or alarm thresholds are triggered. This capability minimizes application downtime, reduces the impact of problematic deployments, and ensures service availability. Without auto rollback enabled, failed deployments may require manual intervention to restore service, potentially leading to extended outages and degraded user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | SI-2 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codepipeline-region-fanout-check | CP-6 (1) | Deploying applications to multiple regions can improve both latency and availability for your application. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | AC-3, IA-2 | Preventing unauthenticated access to Cognito Identity Pools is critical for maintaining security boundaries and implementing proper access controls. Allowing unauthenticated identities can expose AWS resources to unauthorized users, potentially leading to data breaches, resource abuse, or compliance violations. By monitoring and detecting Identity Pools with unauthenticated access enabled, organizations can ensure that all users are properly authenticated before receiving temporary AWS credentials, supporting defense-in-depth security strategies and regulatory compliance requirements. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-advanced-security-enabled | AC-12, AC-3 | Advanced security features in Cognito user pools are essential for protectin g against unauthori zed access and potential threats. Without these features, user accounts may be more vulnerable to attacks such as credential stuffing or brute force attempts. Enabling advanced security strengthens overall user authentic ation and access control. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | CM-8 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | AU-12, AU-2, AU-3, AU-3 (1) | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| custom-eventbus-policy-attached | AC-3 | Attaching a resource policy helps control access to custom EventBus resources , enforcing least privilege and reducing the risk of unauthorized access. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cw-loggroup-retention-period-check | AU-11 | Configuring retention periods for Amazon CloudWatch log groups ensures that data is kept for the required duration, to meet organizational compliance requirements, and allows the review and investigation of suspicious activities. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | SC-13, SC-23, SC-8, SC-8 (1) | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-task-data-verification-enabled | SI-7 | Data verification in DataSync tasks is critical for ensuring data integrity during transfer operation s. When enabled, DataSync performs additional checksums and validation to verify that data has been accuratel y transferred from source to destinati on. This helps detect potential data corruption, incomplete transfers , or transmission errors that could compromise data quality. Without verification, organizat ions may unknowing ly have corrupted or incomplete data in their destination systems, which could lead to application failures, data loss, or compliance violation s in regulated environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-task-logging-enabled | AU-12, AU-2, AU-3, AU-3 (1) | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-encryption-enabled | SC-28 (1) | Encrypting DynamoDB Accelerator Clusters at rest is essential to safeguard sensitive information and maintain data confidentiality. By employing encryption, organizations can thwart unauthorized access to data, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Spain), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | SC-13, SC-8, SC-8 (1) | HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. You should only allow encrypted connections over TLS to access DAX clusters. However, encrypting data in transit can affect performance. You should test your application with encryption turned on to understand the performance profile and the impact of TLS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| dynamodb-pitr-enabled | CP-10 (2), CP-9 | Implement point in time recovery risk mitigation measures to ensure your data is protected and can be restored to a specific point in the past whenever needed. This helps increase resiliency and availability of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-resources-protected-by-backup-plan | CP-10 (2), CP-9 | Failure to backup DynamoDB tables can result in a loss of mission critical data in the event of a failure or security incident. Enabling and properly configuring AWS Backup to match the organization's backup requirements is crucial to restore data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-table-encrypted-kms | SC-28 (1) | Encryption of data at rest in DynamoDB is enabled by default. Using AWS KMS reduces the operational complexity of managing encryption keys by integrating transparently with DynamoDB. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-table-encryption-enabled | SC-28 (1) | Provide data security and privacy by ensuring encryption is enabled for your DynamoDB tables. | Available in all commercial Regions except Asia Pacific (New Zealand). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-in-backup-plan | CP-9 | Failure to backup EBS volumes can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availabil ity, and recoverab ility, essential for the continuity of operations and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-last-backup-recovery-point-created | CP-9 | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Amazon Elastic Block Store (EBS) volumes in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-resources-in-logically-air-gapped-vault | SC-7 | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-protected-by-backup-plan | CP-9 | Failure to backup EBS volumes can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for the continuity of operations and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-snapshot-public-restorable-check | AC-6 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | CM-8 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | CM-8 | Proper tagging of EC2 carrier gateways is essential for resource managemen t, cost allocatio n, access control, operational visibilit y. Tags enable organizations to categorize track network infrastru cture component s, implement automated governance policies, maintain complianc e with organizat ional standards. Consistent tagging practices facilitat e resource identific ation, billing attributi on, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | CM-8 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-not-authorize-all | AC-4, SC-7, SC-7 (4) | Restricting authorized networks for Amazon VPC Lattice endpoints helps prevent unauthorized access and potential security breaches from untrusted networks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-ebs-encryption-by-default | SC-28 (1) | Sensitive data can exist at rest on EBS volumes. All sensitive data should be protected at rest using strong cryptography, to protect the confidentiality and integrity of information and prevent and protect data in storage. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | AC-4, SC-7, SC-7 (3), SC-7 (5) | Source/destination check is a critical security feature that ensures network interfaces can only send receive traffic that is specifically destined for or originates from the interface. Disabling this check without proper justification can create security vulnerabilities by allowing traffic forwarding potential network bypasses. Monitoring this setting helps maintain network security boundaries, prevents unauthorized traffic routing, ensures compliance with network security policies. This control is particularly important for maintaining the integrity of network traffic flows preventing potential security misconfigurations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-fleet-tagged | CM-8 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | CM-2, CM-3, CM-6 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-managed-by-systems-manager | CM-2 (2), CM-6, CM-7 (5), SI-2 (2) | Amazon EC2 instances managed by AWS SSM helps maintain security and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | SC-23, SI-2 (2) | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-association-compliance-status-check | MA-4 | SSM interactive sessions provide centralized and granular access controls to EC2 instances and enhance reliability along with user attribution in sessions. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-patch-compliance-status-check | SI-2 (2) | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | CM-8 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-tagged | CM-8 | Proper tagging of Network Insights access scopes enables effective resource management, cost allocation, governance across AWS environments. Tags provide essential metadata for tracking resource ownership, purpose, lifecycle management. Consistent tagging practices support automated operations, security policies, compliance reporting requirements. Without adequate tagging, organizations lose visibility into resource utilization patterns struggle to implement effective cost controls access management policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-path-tagged | CM-8 | Proper tagging of Network Insights paths enables effective resource management, cost allocation, operational governance. Tags facilitate automated resource discovery, support compliance reporting requirements, enable consistent application of organizational policies across network analysis resources. Without standardized tagging, organizations lose visibility into resource ownership, purpose, associated costs, making it difficult to maintain operational control meet regulatory requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-in-logically-air-gapped-vault | SC-7 | Logical air-gapping is essential for protecting critical compute resources from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive systems. Implementing air-gapping provides an additional security barrier for critical EC2 instances. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-protected-by-backup-plan | CP-9 | Amazon EC2 backup on AWS involves creating snapshots of your EC2 instances and their attached EBS volumes. These snapshots capture the instance's data at a specific point in time, allowing you to create reliable backups and recover instances in case of data loss or system failures. By utilizing EC2's snapshot and AMI (Amazon Machine Image) features, you can efficiently manage and restore your instances and their data. Not backing up EC2 instances exposes your data to potential loss in the event of hardware failures, accidental deletions, or software errors. Without backups, recovery becomes challenging and time-consuming, risking | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | downtime and data integrity. Regular backups are crucial to mitigate these risks and ensure business continuity. | |
| ec2-security-group-attached-to-eni | AC-4, SC-7, SC-7 (4) | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-security-group-attached-to-eni-periodic | AC-4, SC-7, SC-7 (4) | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | SC-13, SC-28, SC-28 (1) | Enabling encryption at rest for EBS volumes attached to EC2 Spot Fleet instances protects sensitive data from unauthorized access helps meet regulatory compliance requirements. Encryption ensures that data stored on EBS volumes is protected both in transit to the storage backend while at rest, reducing the risk of data exposure in case of unauthorized access to the underlying storage infrastructure. This control is particularly important for Spot Fleet instances as they may be terminated recreated frequently, making consistent encryption enforcement critical for maintaining data security across the fleet lifecycle. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-traffic-mirror-session-description | SA-5 | Requiring descriptions for EC2 traffic mirror sessions enhances operational visibility security management by ensuring each session is properly documented with its intended purpose, scope, configuration details. This documentation is critical for security auditing, troubleshooting network issues, compliance reporting, maintaining an organized traffic monitoring infrastructure. Well-documented mirror sessions help security teams quickly identify the purpose of network monitoring activities ensure that traffic mirroring is being used appropriately within the environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-traffic-mirror-target-description | SA-5 | Requiring descriptions for EC2 traffic mirror targets enhances operational visibility security management by providing context about the purpose configuration of network monitoring infrastructure. Proper documentation through descriptions enables administrators to quickly identify the role of each traffic mirror target, facilitates troubleshooting, supports compliance auditing, reduces the risk of misconfiguration or unauthorized network monitoring activities. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-auto-vpc-attach-disabled | AC-4, SC-7, SC-7 (4) | Transit Gateways should not automatically accept shared attachments. Cross-account attachment requests should be manually reviewed to ensure that the source is trusted. One way to enforce this is to disable the 'auto accept shared attachments' feature in Transit Gateways so that other accounts cannot connect to the Transit Gateway without manual review and explicit authorization. | Available in all commercial Regions except Asia Pacific (Melbourne) and Asia Pacific (Osaka). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | CM-8 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | AU-12, AU-2, AU-3, AU-3 (1) | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | CM-8 | Proper tagging of VPN connections enables effective resource managemen t, cost allocatio n, governance oversight. Tags facilitate automated operations, security policies, complianc e reporting by providing metadata that identifies resource ownership, purpose, environme nt, other critical attributes. Consisten t tagging practices improve operation al visibility support organizational policies for resource lifecycle managemen t. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | SI-2 (2) | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabilities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | CM-8 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | CM-6 | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | CM-8 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | SC-7, SC-7 (3), SC-7 (5) | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | CP-9 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-filesystem-ct-encrypted | SC-28, SC-28 (1) | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryption, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | CM-8 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| efs-in-backup-plan | CP-9 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | AC-3, AC-4, SC-7, SC-7 (5) | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-resources-in-logically-air-gapped-vault | SC-7 | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-resources-protected-by-backup-plan | CP-9 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| eip-attached | AC-4, SC-7 | A disassociated Elastic IP (EIP) remains allocated to your account until you explicitly release it. A small hourly charge is incurred for Elastic IP addresses that are not associated with a running EC2 instance. If you no longer need an Elastic IP address, it is recommended that you release it. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | CM-8 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operational visibility. Tags enable organizations to categorize track add-ons by environment, owner, project, or cost center, facilitating accurate billing resource governance. Consistent tagging practices support automated management workflows, security policies, compliance reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernetes infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | AU-12, AU-2, AU-3, AU-3 (1) | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | SC-12, SC-13, SC-28, SC-28 (1) | When you encrypt secrets, you can use AWS Key Managemen t Service (AWS KMS) keys to provide envelope encryptio n of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryptio n for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applicati ons by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | CP-9 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-redis-cluster-automatic-backup-check | CP-9 | Enabling backups ensures that data is protected against accidental deletion, data corruption, and in the case of a system failure, you can restore your cluster from a backup, minimizin g downtime and ensuring business continuity. Point-in-time backups can restore your cluster to a specific point in time. Backups can be used for testing and development purposes, where a copy of the productio n cluster can be replicated for testing new features, debugging, or other development activitie s without impacting the live environment. | Available in all commercial Regions except Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-at-rest | SC-28 (1) | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-in-transit | SC-8 (1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic, and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-subnet-group-check | AC-4 | When launching an Amazon ElastiCac he cluster, a default subnet group is created if one doesn't exist already. The default group uses subnets from the default Virtual Private Cloud (VPC). Using custom subnet groups is more restrictive of the subnets that the cluster resides in, and the networking that the cluster inherits from the subnets. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-description | SA-5 | Application descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand application purposes, enables effective resource governance, assists in troubleshooting and maintenance activities, and ensures accountability in multi-team environments. Well-documented applications also support audit processes and help maintain organizational knowledge as team members change over time. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-version-description | SA-5 | Application version descriptions provide essential documentation for tracking changes, understanding deployment history, and maintaining operational visibility. Proper documentation enables teams to quickly identify the purpose and contents of specific application versions, facilitates troubleshooting and rollback procedures, and supports compliance requirements for change management. Without descriptions, organizations lose critical context about application deployments, making it difficult to manage the application lifecycle effectively and increasing the risk of deploying incorrect or outdated versions. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-environment-description | SA-5 | Environment descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand the purpose and context of each environment, reduces troubleshooting time, and ensures accountability in multi-team environments. This practice is particularly important for maintaining clear separation between development, staging, and production environments while supporting audit trails and change management processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-node-to-node-encryption-check | SC-8 (1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | CA-7, SI-4 | Enhanced health reporting in Elastic Beanstalk provides deeper visibility into application health status beyond basic instance health checks. This capability monitors additional metrics including CPU utilization, application latency, and request rates, enabling more effective troubleshooting and faster incident response. Without enhanced health reporting, organizations may experience delayed detection of performance degradation, potentially resulting in extended service disruptions and negative impact on application availability. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | SC-13, SC-8, SC-8 (1) | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-multiple-az | CP-7 | By distributing traffic to registere d instances in multiple availabil ity zones (AZs) the ELB provides high availability, automatic scaling, and robust security that improves fault-tolerance for cloud resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| elb-acm-certificate-required | SC-8 (1) | Encrypt data in transit to maintain the confidentiality and integrity of data as it traverses public and unsecured networks and reduce the risk of unauthori zed access to data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-cross-zone-load-balancing-enabled | CP-7 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | SC-7, SC-7 (3) | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | CM-8 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | SC-8 (1) | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-master-no-public-ip | SC-7 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | SC-12, SC-13, SC-28, SC-28 (1) | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | SC-13, SC-8, SC-8 (1) | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data processing workloads. | |
| encrypted-volumes | SC-13, SC-28, SC-28 (1) | Encrypting data at rest on EBS volumes facilitates protectio n of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-launch-description | SA-5 | Requiring descriptions for Evidently launches enhances operational visibility and governance by ensuring proper documentation of feature experiments and rollouts. Descriptive metadata helps teams understand the purpose and context of launches, facilitates troubleshooting and audit processes, and supports effective collaboration across development and operations teams. This practice is essential for maintaining organized experimentation workflows and meeting documentation requirements for compliance frameworks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-description | SA-5 | Requiring descriptions for CloudWatch Evidently projects enhances operational visibility and governance by ensuring proper documentation of project purposes and objectives. Well-documented projects facilitate team collaboration, simplify project management, enable better resource tracking, and support compliance requirements for maintaining clear audit trails of experimentation activities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-description | SA-5 | Requiring descriptions for CloudWatch Evidently segments enhances operational visibility governance by ensuring proper documentation of audience segmentation logic. Well-documented segments improve team collaboration, facilitate troubleshooting of feature flag behaviors, support compliance requirements for change management audit trails. Clear segment descriptions help prevent misconfigurations enable more effective monitoring of experimental features across different user populations. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-tagged | CM-8 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentation. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | AU-12, AU-2 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | CM-8 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-entity-type-tagged | CM-8 | Proper tagging of Fraud Detector entity types is essential for maintaining operational visibilit y and control. Tags facilitate effective resource managemen t, cost tracking, and access control implementation. Without structured tagging, organizat ions risk losing oversight of their fraud detection infrastructure and associated resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-label-tagged | CM-8 | Tagging Fraud Detector labels is crucial for maintaining clear visibility and control over fraud detection configurations. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and analyze their fraud detection labels. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-outcome-tagged | CM-8 | Tagging Fraud Detector outcomes is essential for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their fraud detection outcomes and associated analysis capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-variable-tagged | CM-8 | Proper tagging of Fraud Detector variables is crucial for maintaining clear visibility and control over fraud detection configurations. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may face challenges in managing and analyzing their fraud detection variables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | CM-8 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-resources-protected-by-backup-plan | CP-9 | Failure to backup Amazon FSx file systems can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | AU-12, AU-2, AU-3, AU-3 (1) | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | CM-8 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | CM-8 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | AU-12, AU-2, AU-3, AU-3 (1) | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | SC-13, SC-28, SC-28 (1) | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | SI-4 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | CA-7, SI-4, SI-4 (2) | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | visibility in container ized environments meeting complianc e requirements for runtime threat detection. | |
| guardduty-eks-prot ection-audit-enabled | AU-6, CA-7, SI-4, SI-4 (2) | EKS Audit Log Monitoring is crucial for maintaining security visibilit y in Kubernete s environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilit ies for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | CA-7, SI-4, SI-4 (2) | Runtime monitoring is essential for detecting and responding to security threats in containerized environments. Without runtime monitoring, organizations may be unable to detect container-level security incidents in real-time. Implementing automated runtime monitoring enhances container security posture. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | AU-6 (1), AU-7 (1), IR-4, IR-4 (1), SI-4, SI-4 (2), SI-4 (5) | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| guardduty-lambda-protection-enabled | CA-7, SI-4, SI-4 (2), SI-5 | Lambda Protection is crucial for maintaining security visibility in serverless architectures. Without this feature, organizations may miss potential security threats targeting their Lambda functions. Enabling Lambda Protection provides enhanced security monitoring for serverless workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | CA-7, SI-3, SI-4, SI-4 (2) | Malware Protection is essential for maintaining a strong security posture against malicious software. Without this feature, organizations may be vulnerable to undetected malware threats. Implementing Malware Protection enhances threat detection capabilities across AWS resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| guardduty-non-archived-findings | AU-7 (1) | Resolving GuardDuty findings is essential to maintaining a secure and resilient cloud environment. By addressing these findings, you proactively mitigate potential security risks and vulnerabilities, safeguarding sensitive data and infrastructure from unauthorized access and malicious activities. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | CA-7, SI-4, SI-4 (2) | RDS Protection is crucial for maintaining database security and detecting potential threats. Without this feature, organizations may miss security incidents targeting their database instances. Enabling RDS Protection provides enhanced security monitoring for database environments. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | CA-7, SI-4, SI-4 (2) | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | CA-7, SI-4, SI-4 (2) | S3 Protection is essential for maintaining security visibility over storage resources. Without this feature, organizations may miss potential security threats targeting their S3 buckets. Enabling S3 Protection enhances threat detection capabilities for storage environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-group-has-users-check | AC-3, AC-6 | AWS IAM user groups that do not contain any users adds unnecessary operational complexit y, increases oversight and could lead to unintentional risk. Ensuring that all user groups have user accounts simplifie s management and oversight and reduces risk. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | CM-8 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | AC-2, IA-2, IA-5, IA-5 (1) | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | AC-3, AC-6, AC-6 (10), AC-6 (5), AU-9 (4), CM-5 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | AC-3, CM-5 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | CM-8 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | SC-12, SC-17 | Certificate expiration monitoring is essential for maintaining secure communications. Expired certificates can lead to service disruptions and security vulnerabilities. Regular monitoring helps prevent certificate-related outages and security issues. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | CM-8 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-no-policies-check | AC-3, AU-9 (4), CM-5 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | AC-2 (3) | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| restricted-ssh | AC-17 (1), AC-17 (3), AC-4, CM-7, SC-7 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | RA-5 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | RA-5 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | RA-5 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | RA-5 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| internet-gateway-authorized-vpc-only | AC-4, SC-7, SC-7 (4) | This control provides a mechanism that forces attention on which VPC(s) should be allowed to access the public internet. This control will require the appropriate VPC(s) to be identified and labeled as approved for internet accesses through use of an IGW. Failure to identify and validate the list of authorized VPC's could cause unintended access to AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | CM-8 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | CM-8 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | CM-8 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iotsitewise-gateway-tagged | CM-8 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | CM-8 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | CM-8 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industrial IoT initiatives. Without proper tagging, organizations may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | CM-8 | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | IA-5, SC-13 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | CM-8 | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | AC-3, SI-4 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | SC-13, SC-28, SC-28 (1) | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | SI-12 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | AC-3, IA-7, SC-12 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | CM-8 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | CA-7, SI-4, SI-4 (2) | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | CM-8 | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-certificate-tagged | CM-8 | Tagging Lightsail certificates enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking certificate ownership, purpose, and lifecycle management. Consistent tagging practices improve operational visibility, facilitate automated management tasks, and support compliance requirements by ensuring all SSL/TLS certificates can be properly identified and categorized within the infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-disk-tagged | CM-8 | Proper tagging of Lightsail disks enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support complianc e requirements for asset identification. Without consistent tagging, organizat ions lose visibility into resource utilizati on, struggle with cost attribution, and face challenge s in implement ing automated management workflows. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| mfa-enabled-for-iam-console-access | IA-2 (1), IA-2 (2) | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | IA-2, IA-5 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-single-instance-broker-storage-type-efs | CP-6, CP-6 (1), CP-6 (3) | Using EFS storage type for Amazon MQ ActiveMQ single-instance brokers provides enhanced durability, availability, and performance characteristics compared to other storage options. EFS offers automatic scaling, built-in redundancy across multiple Availability Zones, and better integration with AWS backup and recovery services. This storage configuration helps ensure message persistence, reduces the risk of data loss during broker failures, and supports better disaster recovery capabilities for messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-automatic-minor-version-upgrade-enabled | SI-2 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-auto-minor-version-upgrade-enabled | SI-2, SI-2 (2) | As Amazon MQ releases and supports new broker engine versions, the changes are backward-compatible with an existing application and dont deprecate existing functionality. Automatic broker engine version updates protect you against security risks, help fix bugs, and improve functionality. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | AU-12, AU-2 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-log-enabled | AU-12, AU-2 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | AC-4, SC-7, SC-7 (5) | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastru cture. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderaba d), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | SC-7, SC-7 (3), SC-7 (5) | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-cluster-tagged | CM-8 | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | AU-12, AU-2, AU-3 | Enabling logging for an Amazon MSK connector captures operational and error events needed to detect anomalous behavior, troubleshoot failures, and support security investigations. Without connector logs, malicious or erroneous activity can go unnoticed and forensic analysis is limited. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-enhanced-monitoring-enabled | CA-7, SI-4 | Enhanced monitoring is crucial for maintaining operational visibility and performance of Kafka clusters. Without detailed monitoring, organizations may miss critical performance issues or capacity problems. Implementing enhanced monitoring supports better cluster management and troubleshooting. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| msk-in-cluster-node-require-tls | SC-8 (1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting data in transit also reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | AC-3, AC-6, IA-2, IA-8 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | AU-12, AU-2, AU-3 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nacl-no-unrestricted-ssh-rdp | AC-17 (1), AC-17 (3), AC-4 | Network access control list (NACL) should not allow unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| neptune-cluster-backup-retention-check | CP-10 (2), CP-9 | Backups help to recover more quickly from a security incident and strengthen the resilience of the systems. Automating backups for Amazon Neptune DB clusters, enables to restore systems to a point in time, and minimize downtime and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | SC-28, SC-28 (1) | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-multi-az-enabled | CP-6, CP-7 | Multi-AZ configuration is essential for maintaining database availability and data resilience. Without Multi-AZ, Neptune clusters are vulnerable to single points of failure. Implementing Multi-AZ replication enhances database reliability and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-encrypted | SC-28 (1) | Enabling encryption at rest for Amazon Neptune DB cluster snapshots protects the data against unauthorized access to sensitive data, and helps achieve compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-multi-az-enabled | AC-4, SC-7, SC-7 (4) | By deploying a AWS Network Firewall firewall across multiple AZs, traffic can be balanced and shifted among AZs, which helps in designing highly available solutions. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-rule-group-associated | AC-4, SC-7, SC-7 (4) | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | AC-4, SC-7, SC-7 (4) | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | AC-6 (10), CM-3, CM-5, CM-6, SC-7 | Enabling subnet change protection on Network Firewall instances prevents unauthorized modifications to firewall subnet associations, which could compromise network security boundaries and traffic inspection capabilities. This protection helps maintain the integrity of network segmentation policies and ensures that firewall rules continue to be applied to the intended network traffic flows. Without this protection, malicious actors or accidental configuration changes could bypass security controls by modifying subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-cross-zone-load-balancing-enabled | CP-7 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | SC-7, SC-7 (3), SC-7 (5) | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | CM-8 | Proper tagging of Network Load Balancer listeners enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundaries and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | AU-12, AU-2, AU-3 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | CM-8 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | SC-7, SC-7 (4) | Restricting access to the IGW enhances the security of EC2 instances by protecting sensitive data and reduces the potential for data breaches or unauthorized activities. Restricting access to the IGW aligns with the principle of least privilege and allows for implementation of network segmentation and isolation strategies by controlling outbound connections creating communication boundaries between different parts of network infrastructure reducing the occurrence of lateral movement of threats, limits the impact of potential security incidents, and enhances overall network security and resilience. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | CP-7 | Configuring OpenSearch domains with at least three data nodes and multi-AZ enabled enhances availability, fault tolerance, scalability, performance, data resilience, and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-https-required | SC-8 (1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-node-to-node-encryption-check | SC-8 (1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | CP-10, CP-6, CP-7 | Primary node fault tolerance is crucial for maintaining OpenSearch cluster reliability. Without sufficient primary nodes, clusters are at risk of service disruptions during node failures. Implementing a three-node primary configuration provides robust fault tolerance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3 (1) | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | SC-28 (1) | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-db-security-group-not-allowed | AC-4, SC-7, SC-7 (5) | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. This includes blocking traffic to and from 0.0.0.0/0. | Available only in US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | CM-8 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-subnet-igw-check | SC-7, SC-7 (5) | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-in-backup-plan | CP-10 (2), CP-9 | Failure to backup RDS instances can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuri ng backups to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-last-backup-recovery-point-created | CP-10 (2) | Automated backups allow point-in-time recovery for Amazon Relational Database Service (RDS) databases. Enabling this ensures recovery capabilities in the event of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | CM-8 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3 (1) | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | SC-13, SC-8, SC-8 (1) | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-resources-protected-by-backup-plan | CP-10 (2), CP-9 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3 (1) | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | SC-28, SC-28 (1) | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-backup-enabled | CP-10 (2), CP-9 | Snapshots can be used for data recovery or copied to other regions for the creation of new clusters with existing data. Snapshots play an important role in a disaster recovery and data retention requirements, allowing for the survival of an altered or terminated cluster, or for recovery due to security incidents. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-configuration-check | SC-28 (1) | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-kms-enabled | SC-28 (1) | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | CP-2, CP-6, CP-7, CP-7 (1) | Enabling Multi-AZ deployment for an Amazon Redshift cluster maintains a standby in a second Availability Zone and fails over automatically if an AZ becomes impaired. This improves the availability and resilience of the data warehouse and reduces the risk of data unavailability during infrastructure failures. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-subnet-group-multi-az | CP-6, CP-7, CP-7 (1) | Configuring a Redshift cluster subnet group with subnets in more than one Availability Zone allows the cluster to be provisioned or recovered across AZs. This improves availability and resilience and reduces the risk that a single AZ disruption makes the data warehouse unavailable. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-require-tls-ssl | SC-8 (1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | CM-2, CM-6 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | AU-12, AU-2, AU-3 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | SC-13, SC-8, SC-8 (1) | An Amazon Redshift Serverless workgroup is a collection of compute resources that groups together compute resources like RPUs, VPC subnet groups, and security groups. Properties of a workgroup include network and security settings. These settings specify whether connections to a workgroup should be required to use SSL to encrypt data in transit. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | SC-7, SC-7 (3), SC-7 (5) | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | AC-4, SC-7 | If enhanced VPC routing is disabled for an Amazon Redshift Serverless workgroup, Amazon Redshift routes traffic through the internet, including traffic to other services within the AWS network. If you enable enhanced VPC routing for a workgroup, Amazon Redshift forces all COPY and UNLOAD traffic between your cluster and your data repositories through your virtual private cloud (VPC) based on the Amazon VPC service. With enhanced VPC routing, you can use standard VPC features to control the flow of data between your Amazon Redshift cluster and other resources. This includes features such as VPC security groups and endpoint | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | policies, network access control lists (ACLs), and Domain Name System (DNS) servers. You can also use VPC flow logs to monitor COPY and UNLOAD traffic. | |
| redshift-unrestricted-port-access | AC-4, SC-7, SC-7 (3), SC-7 (5) | Permitting unrestricted inbound access to the Redshift cluster port (IP address with a /0 suffix) can result in unauthorized access or security incidents. We recommend applying the principal of least privilege access when creating security groups and configuring inbound rules. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| required-tags | CP-2 (8) | Tags can help you manage, identify, organize, search for, and filter resources. Tagging can also be used to create new resource construct s for visibility or control (such as grouping together resources that make up a micro-service, application, or workload). Tagging is fundamental to providing enterpris e-level visibility and control. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | AC-4, SC-7, SC-7 (4), SC-7 (5) | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. Not restricting access to ports to only authorized users, can lead to attacks against the availabil ity, integrity and confidentiality of systems. Security Group configurations should not allow ingress traffic from 0.0.0.0, but instead should specify trusted sources per port. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | IA-5 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentials making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | IA-2 (1) | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | CM-8 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| route53-hosted-zone-tagged | CM-8 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-in-vpc-only | AC-4, SC-7 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks | AC-4, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | AC-4, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-acl-prohibited | AU-9 | Simplify access management of S3 data by replacing bucket access control lists with IAM (and other) policies to regulate permissions to S3 buckets. Unless there is a need to control access to each object individually, disable ACLs and use policies to control ownership and access. Object ownership means the bucket owner owns all the objects in the bucket, even when uploaded by different AWS accounts, and allows for easy access management. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-default-lock-enabled | AU-9 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-level-public-access-prohibited | AC-4, AU-9, SC-7 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | AU-12, AU-2, AU-3 | Server access logging provides a mechanism to detect potential cybersecurity events, unauthorized access and suspicious activity. Each access log record provides details about a single access request and contains the requester, bucket name, request time, request action, response status, and an error code, if relevant. Server access logs are sent from a source bucket to a chosen target S3 bucket in the same AWS Region to ensure redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-read-prohibited | AC-3, AC-4, AC-6, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | AC-3, AC-4, AC-6, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-replication-enabled | CP-6, CP-6 (1) | Enabling S3 cross-region replication is crucial for ensuring data availability, durability, and compliance. It helps protect against data loss, regional outages, and provides a mechanism for disaster recovery. By replicating data to a different region, organizations can maintain business continuity and meet regulatory requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | AU-9, SC-28 (1) | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-ssl-requests-only | SC-8 (1) | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-tagged | CM-8 | Tagging S3 buckets is essential for effective resource management, cost allocation, and governance. Tags enable organizations to categorize buckets by purpose, owner, environment, or project, facilitating accurate cost tracking and billing. Proper tagging also supports automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | AU-9 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and applicati on failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanent ly, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encrypt ion-kms | AU-9, SC-28 (1) | Protecting objects in S3 using encryptio n at rest with KMS prevents unauthori zed access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | AU-11, AU-4 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | CP-9 | Performing data backups is critical to a disaster recovery plan. Data is vulnerable to hardware or software malfunctions or data corruption, cyberattacks, accidental deletion, calamities, and more. Ensuring that data is backed up will mitigate the forementioned risks. IMPORTANT NOTE: You must enable S3 Versioning on your S3 bucket to use AWS Backup for Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | AU-11, AU-4 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | SC-7, SC-7 (3), SC-7 (5) | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | CM-8 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-config-prod-instance-count | CP-7, CP-7 (1) | Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architect ure. High availabil ity helps you to recover from security incidents. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | CM-8 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-image-description | SA-5 | Requiring descriptions for SageMaker images enhances operational visibility and governance by providing essential metadata about image contents, purpose, and usage. Proper documentation through descriptions facilitates image management, enables teams to understand image functionality, supports compliance auditing, and reduces the risk of using inappropriate or outdated images in machine learning workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | SC-7, SC-7 (3) | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | SC-28, SC-7, SC-7 (3) | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | AU-6 (1), AU-6 (3), CA-7, CA-7 (4), IR-4 (1) | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | CM-8 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | AC-3 | Portfolio sharing only within Organizations helps ensure that a portfolio isnt shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub recommends using ORGANIZATIONMEMBER ACCOUNT instead of ACCOUNT. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ses-malware-scanning-enabled | SI-8 | Malware scanning in SES is crucial for protecting email workflows from potential security threats. Without scanning, malicious attachments or spam could infiltrate your systems. Implementing malware scanning helps maintain email security and prevents potential infections. | Available only in US East (N. Virginia), US West (Oregon), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-message-delivery-notification-enabled | IR-6 (1) | Logging message delivery status helps provide better operational insight, such as, knowing whether a message was delivered to the Amazon SNS endpoint, identifying the response sent from the Amazon SNS endpoint to Amazon SNS, determining the message dwell time (the time between the publish timestamp and just before handing off to an Amazon SNS endpoint). | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | AC-3, AC-4 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-dlq-check | SI-10 | Dead letter queues are essential for robust message processing architectures as they provide a mechanism to isolate and examine messages that repeatedly fail processing. Without DLQ configuration, failed messages may be lost permanently or continue consuming processing resources through infinite retry loops. This control helps ensure message durability, enables debugging of processing failures, prevents resource exhaustion from problematic messages, and supports compliance requirements for data retention and audit trails in distributed systems. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | AC-3, AC-6 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | based application architectures. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | AC-3, AC-6 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | AC-3, AC-6 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | AU-12, AU-2, AU-3 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | CM-8 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-agreement-description | CA-3 | Requiring descriptions for Transfer Family agreements enhances operational visibility governance by ensuring each agreement is properly documented with its purpose, scope, business context. This documentation is essential for compliance auditing, troubleshooting data transfer issues, maintaining clear accountability for file transfer partnerships. Well-documented agreements also facilitate knowledge transfer between team members support regulatory requirements that mandate proper documentation of data sharing arrangements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-connector-logging-enabled | AU-12, AU-2, AU-3 | Enabling CloudWatch logging for AWS Transfer Family Connectors is essential for maintaining operational visibility, security monitoring, compliance requirements. Comprehensive logging enables organizations to track file transfer activities, monitor connector performance, detect anomalous behavior, maintain audit trails for regulatory compliance. Without proper logging, organizations lose critical visibility into data transfer operations, making it difficult to troubleshoot issues, investigate security incidents, or demonstrate compliance with data governance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | SC-13, SC-8, SC-8 (1) | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining virtual machine data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of VM failures. Implementing regular backups provides a reliable mechanism for virtual machine protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-in-logically-air-gapped-vault | CP-9 | Regular recovery point creation is crucial for maintaining volume data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of volume failures. Implementing regular backups provides a reliable mechanism for volume protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-protected-by-backup-plan | CP-9 | Ensuring EC2 instances are included in a backup plan allows for recovery of instance data and applications in the event of loss or corruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-default-security-group-closed | AC-4, SC-7, SC-7 (4), SC-7 (5) | Default VPCs and any VPCs that are created come with a default security group. With some resources , default security group is automatic ally assigned if the resource is created without specifying a custom security group. Default security group outbound/inbound rule allows all traffic and this can increase opportunities for malicious activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | AC-4 | Having unused network Access Control Lists (ACLs) increases the risk of unauthorized access to VPC EC2 resources and should be removed once not needed any longer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-peering-dns-resolution-check | AC-4, SC-7, SC-7 (4) | VPC peering reduces network latency by using only internal addresses. It enhances network security by not exposing services to the public internet and reduces potential DNS based attacks which can compromise the confidentiality, integrity and availability of resources in the VPCs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-open-only-to-authorized-ports | AC-4, SC-7, SC-7 (4) | High risk ports are often exposed to the Internet and easily exploitable by attackers. Security groups provide stateful filtering of ingress and egress network traffic to AWS. Security group rules should follow the principal of least privileged access. Unrestricted access (IP address with a /0 suffix) increases the opportunity for malicious activity such as hacking, denial-of-service attacks, and loss of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | SC-7, SC-7 (3), SC-7 (5) | Security groups provide stateful filtering of ingress and egress network traffic to AWS resources. We recommend that no security group allow unrestricted ingress access to remote server administration ports, such as SSH to port 22 and RDP to port 3389, using either the TDP (6), UDP (17), or ALL (-1) protocols. Permitting public access to these ports increases resource attack surface and the risk of resource compromise. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-not-empty | AC-4 | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | CM-8 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-root-volume-encryption-enabled | SC-13, SC-28, SC-28 (1) | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | SC-13, SC-28, SC-28 (1) | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | CM-8 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## ISO/IEC 27001:2022 - Annex A

This AWS Config managed conformance pack provides a curated mapping between the ISO/IEC 27001:2022 Annex A controls and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more ISO/IEC 27001 controls. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** ISO-27001-ANNEX-A_2022

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 157 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| access-keys-rotated | 8.24 | Rotating access keys will reduce the window of opportunity for an access key that is associated with a compromised or terminated account to be used. Access keys should be rotated to ensure that data cannot be accessed with an old key which might have been lost, cracked, or stolen. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | | in the AWS GovCloud (US) Regions. |
| account-part-of-organizations | 8.9 | By enrolling and managing AWS accounts using AWS Organizations, enforcement and consistent security policies and controls are applied across all accounts within the organization. This ensures that security measures, such as access controls, encryption, and logging, are applied uniformly, reducing the risk of unauthorized access, data breaches, and compliance violations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| approved-amis-by-tag | 5.13, 5.9, 8.9 | Tags enable you to categorize your AMIs and EC2 resources in different ways, for example, by purpose, owner, or environment and manage resource operations, such as inventory management, patching, scanning, tracking, etc. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-associated-with-waf | 8.20 | Integrating AppSync with AWS WAF provides protection against common web vulnerabilities like injection, XSS, and unauthorized access, reducing breach risk. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-at-rest | 8.24 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-in-transit | 8.24 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| athena-workgroup-logging-enabled | 8.9 | Audit logs track and monitor system activities. They provide a record of events that can help you detect security breaches, investigate incidents, and comply with regulations. Audit logs also enhance the overall accountability and transparency of your organization. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-mysql-backtracking-enabled | 8.13 | The Backtracking feature allows you to quickly restore DB clusters to a specific point in time, without having to restore backups or launch new DB clusters. Advantages of backtracking include: undo user mistakes easily, explore data changes, and backtrack DB cluster quickly. Backtracking is not a replacement for backing up DB clusters. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Stockholm), Israel (Tel Aviv), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-mysql-cluster-audit-logging | 5.28, 5.33, 8.15 | Database logs can assist with security and access audits and help diagnose availability issues. Audit logs capture a record of database activity, including login attempts, data modifications, schema changes, and other events that can be audited for security and compliance purposes. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-capacity-rebalancing | 8.14 | Capacity Rebalancing ensures the availability of Auto Scaling groups by proactively launching additional EC2 Spot Instances when existing instances are at an elevated risk of interruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-hop-limit | 8.27, 8.9 | Using token hop limits for EC2 prevents attackers from gaining unauthorized access to sensitive resources by chaining together multiple EC2 instances as hops. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-accesslogs-enabled | 5.28, 8.15 | Without CloudFront logs, detailed records of requests will not be available to review and investigate any anomalies that may have occurred. Ensuring access logging cannot be disabled will provide assurance that the data cannot be tampered should a security incident occur for further investigation and remediation. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-custom-ssl-certificate | 5.14, 8.20, 8.24 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-default-root-object-configured | 8.12, 8.26, 8.9 | A user might request the distribution's root URL instead of an object in the distribution. Not defining a default root object can result in requests for the root of your distribution pass to your origin server and expose the contents of your origin, or result in an Error 403 Forbidden. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | 5.14, 8.24, 8.9 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-access-identity-enabled | 5.15, 5.33, 8.3 | By requiring authenticated access control to Amazon CloudFront distributions using Amazon S3 origin types, public access to S3 bucket is blocked while still allowing CloudFront to get objects from the bucket. This protects the integrity of the data being served by the CloudFront distribution. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-s3-origin-access-control-enabled | 5.15, 5.33, 8.3 | By requiring authenticated access control to Amazon CloudFront distributions using Amazon S3 origin types, public access to S3 bucket is blocked while still allowing CloudFront to get objects from the bucket. This protects the integrity of the data being served by the CloudFront distribution. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-sni-enabled | 8.21, 8.24, 8.9 | Using SNI allows CloudFront to associate a domain name with an IP address, and routes each request to the correct edge location, minimizing dropped connections and preventing errors such as "common name mismatch error"and "Your connection is not private. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-traffic-to-origin-encrypted | 5.14, 8.20, 8.24 | Encrypting traffic between CloudFront distribution and its custom origin will ensure that the environment is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-viewer-policy-https | 5.14, 8.20, 8.24 | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | 8.15 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for read data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | if you configure a multi-Region trail that logs read-only or all types of data events for all S3 buckets. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-write-s3-data-event-check | 8.15 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for write data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | if you configure a multi-Region trail that logs write-only or all types of data events for all S3 buckets. | |
| cloudtrail-s3-data events-enabled | 5.28, 8.15 | Logging data events on S3 buckets is an important piece of maintaining the reliability, availabil ity, and performan ce of Amazon S3 and your AWS solutions. Collecting monitoring data for object-level requests supports your Incident Response plan by allowing you to identify potential issues and respond on a timely manner; or to provide valuable data for forensics, auditing, and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-log-group-encrypted | 8.15, 8.24 | Although the CloudWatch Log groups are encrypted by default using SSE (Server Side encryption), encrypting Amazon CloudWatch logs with KMS keys enhances the security and protection of sensitive log data. Encrypting logs at rest ensures if unauthorized individuals gain access to the underlying storage infrastructure, they will not be able to read the log data without the encryption key. Encrypting CloudWatch logs provides an additional layer of defense and assists with preventing unauthorized modification or tampering of log data, ensuring the integrity and reliability of the logs for auditing, troublesh | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | ooting, and forensic analysis purposes. | |
| cloudtrail-enabled | 5.28, 8.15 | Enabling CloudTrail provides essential visibility into your AWS environment by recording API activity and changes, aiding in security monitoring, compliance audits, and troubleshooting incidents. It enhances accountability, enables rapid incident response, and facilitates thorough forensic analysis of events within your cloud infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | 5.33, 8.15, 8.24 | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| codebuild-report-group-encrypted-at-rest | 8.24, 8.9 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | 8.9 | If an Amazon Cognito identity pool allows unauthenticated identities, the identity pool provides temporary AWS credentials to users who havent authenticated through an identity provider (guests). This creates security risks because it allows anonymous access to AWS resources . If you deactivate guest access, you can help ensure that only properly authenticated users can access your AWS resources, which reduces the risk of unauthorized access and potential security breaches. As a best practice, an identity pool should require authentication through supported identity providers. If unauthenticated access is necessary , its important to | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | carefully restrict permissions for unauthenticated identities, and regularly review and monitor their usage. | |
| connect-instance-logging-enabled | 8.15 | Configuring an Amazon Connect instance to generate and store flow logs in CloudWatch captures contact-flow execution details that are essential for monitoring, troubleshooting, and investigating anomalous or unauthorized activity. Without flow logs, operational issues and potential abuse are difficult to detect and analyze. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-task-logging-enabled | 8.15 | Audit logs track and monitor system activities. They provide a record of events that can help you detect security breaches, investigate incidents, and comply with regulations. Audit logs also enhance the overall accountability and transparency of your organization. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | 5.14, 8.24 | HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. You should only allow encrypted connections over TLS to access DAX clusters. However, encrypting data in transit can affect performance. You should test your application with encryption turned on to understand the performance profile and the impact of TLS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-ssl-configured | 8.24 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-mongo-db-authentication-enabled | 8.3 | AWS Database Migration Service supports two authentications methods for MongoDBMONGODB-CR for MongoDB version 2.x, and SCRAM-SHA-1 for MongoDB version 3.x or later. These authentication methods are used to authenticate and encrypt MongoDB passwords if users want to use the passwords to access the databases. Authentication on AWS DMS endpoints ensures that only authorized users can access and modify the data being migrated between databases. Without proper authentication, unauthorized users may be able to gain access to sensitive data during the migration process. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | This can result in data breaches, data loss, or other security incidents. | |
| dms-neptune-iam-authorization-enabled | 8.3, 8.5 | Configuring an AWS DMS endpoint for Amazon Neptune to use IAM authorization ensures database access is governed by IAM identities and policies rather than static credentials. This provides centralized, auditable access control and reduces the risk associated with managing and exposing long-lived database credentials. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-redis-tls-enabled | 5.14, 8.24 | TLS provides end-to-end security when data is sent between applications or databases over the internet. When you configure SSL encryption for your DMS endpoint, it enables encrypted communication between the source and target databases during the migration process. This helps prevent eavesdropping and interception of sensitive data by malicious actors. Without SSL encryption, sensitive data may be accessed, resulting in data breaches, data loss, or other security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-audit-logging-enabled | 8.15 | Enabling Amazon Cloudwatch logs allows you to audit events that were performed in Amazon DocumentDB elastic clusters. Examples of logged events include successful and failed authentication attempts, dropping a collection in a database, or creating an index. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-backup-retention-check | 8.13 | Data loss can occur if recovery points expire before a defined retention period. Defining a retention period for backups for Amazon DocumentDB elastic clusters enables restore of systems to a point in time and minimizes downtime and data loss. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-deletion-protection-enabled | 8.9 | An Amazon DocumentDB cluster cannot be deleted while deletion protection is enabled providing an additional layer of protection against accidental database deletion or deletion by an unauthorized user. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted | 8.24 | Encrypting data at rest protects the confidentiality and integrity of data and reduces the risk of unauthorized access to data. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | 5.14, 8.24 | You can use TLS to encrypt the connection between an application and an Amazon DocumentDB cluster. Use of TLS can help protect data from being intercepted while the data is in transit between an application and an Amazon DocumentDB cluster. Encryption in transit for an Amazon DocumentDB cluster is managed using the TLS parameter in the cluster parameter group thats associated with the cluster. When encryption in transit is enabled, secure connections using TLS are required to connect to the cluster. We recommend using the following TLS parameters: tls1.2, tls1.3, and fips-140-3. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-snapshot-public-prohibited | 5.15, 8.22, 8.3 | Public snapshots are available to all AWS accounts and may result in unintended data exposure. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Israel (Tel Aviv), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-protected-by-backup-plan | 5.30, 8.13 | Amazon EC2 backup on AWS involves creating snapshots of your EC2 instances and their attached EBS volumes. These snapshots capture the instance's data at a specific point in time, allowing you to create reliable backups and recover instances in case of data loss or system failures. By utilizing EC2's snapshot and AMI (Amazon Machine Image) features, you can efficiently manage and restore your instances and their data. Not backing up EC2 instances exposes your data to potential loss in the event of hardware failures, accidental deletions, or software errors. Without backups, recovery becomes challenging and time-consuming, risking | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | downtime and data integrity. Regular backups are crucial to mitigate these risks and ensure business continuity. | |
| ebs-snapshot-public-restorable-check | 8.20, 8.22 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | 8.20 | Source/destination checking for Amazon EC2 instances and attached ENIs should be enabled and configured consistently across your EC2 instances. Each ENI has its own setting for source/destination checks. If source/destination checking is enabled, Amazon EC2 enforces source/destination address validation, which ensures that an instance is either the source or the destination of any traffic that it receives. This provides an additional layer of network security by preventing resources from handling unintended traffic and preventing IP address spoofing. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-detailed-monitoring-enabled | 8.15, 8.16, 8.9 | Enabling detailed monitoring on EC2 instances helps better manage the EC2 resources and facilitates finding trends and taking appropriate actions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-no-public-ip | 8.20, 8.22 | Restricting the use of Public IP helps reduce the risk of unintentional external network communication with EC2 instances. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-profile-attached | 5.15, 5.18, 8.5 | Attaching IAM profiles to EC2 instances allows you to manage permissions and follow the principle of least privilege to prevent unauthorized access to your resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | 5.22 | Running resources on supported software versions ensures optimal performance, security, and access to the latest features. Regular updates safeguard against vulnerabilities, which help ensure a stable and efficient user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-launch-template-public-ip-disabled | 8.21, 8.9 | Assigning public IPs via Amazon EC2 launch template makes any Amazon EC2 instances utilizing that template public and can possibly lead to unintended access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-association-compliance-status-check | 5.15, 5.17, 8.5 | SSM interactive sessions provide centralized and granular access controls to EC2 instances and enhance reliability along with user attribution in sessions. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-protected-by-backup-plan | 5.30, 8.13 | Amazon EC2 backup on AWS involves creating snapshots of your EC2 instances and their attached EBS volumes. These snapshots capture the instance's data at a specific point in time, allowing you to create reliable backups and recover instances in case of data loss or system failures. By utilizing EC2's snapshot and AMI (Amazon Machine Image) features, you can efficiently manage and restore your instances and their data. Not backing up EC2 instances exposes your data to potential loss in the event of hardware failures, accidental deletions, or software errors. Without backups, recovery becomes challenging and time-consuming, risking | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | downtime and data integrity. Regular backups are crucial to mitigate these risks and ensure business continuity. | |
| ec2-security-group-attached-to-eni | 8.20, 8.22 | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-security-group-attached-to-eni-periodic | 8.20, 8.22 | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | 8.24 | For an additional layer of security, you should enable encryption for Amazon EBS volumes. Encryption operations then occur on the servers that host Amazon EC2 instances, which helps ensure the security of both data at rest and data in transit between an instance and its attached EBS storage. Amazon EBS encryption is a straightforward encryption solution for EBS resources associated with your EC2 instances. With EBS encryption, you arent required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-stopped-instance | 7.10, 7.14, 8.10 | Removal of stopped EC2 instances helps ensure that all systems are maintained securely. Since stopped instances are not subject to routine maintenance, such as patches, updates, etc, this could result in the introduction of security risks into the environment if the stopped instance is relaunched. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-token-hop-limit-check | 8.27, 8.9 | Using token hop limits for EC2 prevents attackers from gaining unauthorized access to sensitive resources by chaining together multiple EC2 instances as hops. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-auto-vpc-attach-disabled | 5.15, 5.33, 8.3 | Transit Gateways should not automatically accept shared attachments. Cross-account attachment requests should be manually reviewed to ensure that the source is trusted. One way to enforce this is to disable the 'auto accept shared attachments' feature in Transit Gateways so that other accounts cannot connect to the Transit Gateway without manual review and explicit authorization. | Available in all commercial Regions except Asia Pacific (Melbourne) and Asia Pacific (Osaka). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-logging-enabled | 5.28, 5.33, 8.15 | AWS Site-to-Site VPN logs provide you with deeper visibility into your Site-to-Site VPN deployments. With this feature, you have access to Site-to-Site VPN connection logs that provide details on IP Security (IPsec) tunnel establish ment, Internet Key Exchange (IKE) negotiations, and dead peer detection (DPD) protocol messages. Site-to-Site VPN logs can be published to CloudWatch Logs. This feature provides customers with a single consistent way to access and analyze detailed logs for all of their Site-to-Site VPN connections. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-log-configuration | 8.15 | Collecting data from task definitions provides visibility, which can enable processes debugging and identification of the root cause of errors. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| ecs-task-definition-network-mode-not-host | 8.9 | Host network mode removes network isolation between an ECS container and the host it runs on, exposing the host network interface s and allowing containers to bind directly to host ports. Avoiding host network mode preserves container isolation, limits lateral movement if a container is compromised, and reduces the risk of port conflicts and unintended network exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | 8.13 | Enabling automatic backups for an Amazon EFS file system ensures file data can be recovered after accidental deletion, corruption, or a ransomware event. Regular automated backups reduce the risk of permanent data loss and help meet recovery-point and recovery-time objectives. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-filesystem-ct-encrypted | 8.24 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | 8.9 | An Amazon EFS mount target placed in a subnet that automatically assigns public IP addresses can expose the file system endpoint to the internet, increasing the attack surface and the risk of unauthorized access to file data. Associating mount targets only with private subnets that do not assign public IP addresses on launch keeps EFS access within your VPC and reduces exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | 8.24 | When you encrypt secrets, you can use AWS Key Managemen t Service (AWS KMS) keys to provide envelope encryptio n of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryptio n for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applicati ons by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-secrets-encrypted | 8.24 | Using unencrypted secrets can expose secrets to unauthorized services/individuals which could pose a security risk. By ensuring secrets are encrypted, the risk of unintentional access can be mitigated, and provides defense in depth preventing unauthorized access to the cluster. | Available in all commercial Regions except Asia Pacific (New Zealand). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-encrypted-at-rest | 8.24 | Configuring encryption at rest for OpenSearch is crucial to ensure the security and confidentiality of your data. By encrypting data at rest, you protect it from unauthorized access and potential breaches, mitigating the risk of data exposure. This essential security measure helps maintain compliance with industry standards and regulations, building trust with users and safeguarding your organization's reputation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | 8.16 | Enhanced health reporting in Elastic Beanstalk provides deeper visibility into application health status beyond basic instance health checks. This capability monitors additional metrics including CPU utilization, application latency, and request rates, enabling more effective troubleshooting and faster incident response. Without enhanced health reporting, organizations may experience delayed detection of performance degradation, potentially resulting in extended service disruptions and negative impact on application availability. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | 8.24 | To encrypt data thats transmitted between a client and a load balancer, Elastic Load Balancer listeners should be configured to use industry-standard security protocols: HTTPS for Application Load Balancers, or TLS for Network Load Balancers. Otherwise, data thats transmitted between a client and a load balancer is vulnerable to interception, tampering, and unauthorized access. Use of HTTPS or TLS by a listener aligns with security best practices and helps ensure the confidentiality and integrity of data during transmission. This is particularly important for applications that handle sensitive information, or must comply with security standards | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | that require encryption of data in transit. | |
| emr-master-no-public-ip | 8.20, 8.22 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-security-configuration-encryption-rest | 8.24 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | 8.24 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | 5.9 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| fsx-openzfs-copy-tags-enabled | 5.9 | Identification and inventory of IT assets is a crucial aspect of governance and security. Using tags provides enhanced visibility of FSx backups and volumes so that their security posture can be assessed and action can be taken on potential areas of weakness. | Available in all commercial Regions except Asia Pacific (Melbourne). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-ml-transform-encrypted-at-rest | 8.24 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | 5.28 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | 5.28 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon ECS clusters on AWS Fargate. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-audit-enabled | 5.28, 5.33, 8.15 | GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious or malicious activity in your Amazon EKS clusters, such as unauthorized API calls, privilege escalation, and configuration tampering. Enabling it provides continuous threat detection for the container control plane so that compromises can be identified and investigated quickly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | 5.28, 5.33, 8.15 | EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | 5.28 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Lambda Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Lambda Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | 5.28, 5.33, 8.15, 8.7 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administr ator can enable or disable the Malware Protection feature for the member accounts in the organizat ion. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Malware Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | 5.28 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the RDS Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty RDS Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | 5.28 | In a multi-account environment, only the delegated GuardDuty administrator can enable or disable GuardDuty Runtime Monitoring for accounts in their organization. In addition, only the GuardDuty administrator can configure and manage the security agents that GuardDuty uses for runtime monitoring of AWS workloads and resources for accounts in the organization. GuardDuty member accounts cant enable, configure, or disable Runtime Monitoring for their own accounts. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | 5.28 | Amazon GuardDuty S3 Protection analyzes S3 data-plane events (such as GetObject, PutObject, and DeleteObject) to detect potentially malicious or anomalous access to your S3 data, including credential misuse and data exfiltration. Enabling S3 Protection extends GuardDuty threat detection to your object storage so suspicious activity against sensitive data can be identified and investigated promptly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-external-access-analyzer-enabled | 5.33 | Enabling an IAM Access Analyzer external access analyzer continuously identifies resources that are shared with external principal s, such as other accounts, federated users, or the public. This helps you detect and remediate unintended external access, enforcing least privilege and reducing the risk of data exposure. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-no-inline-policy-check | 5.15, 5.18, 5.2 | Restrict IAM user, role and group from using inline policies. While this can be convenient, using inline policies can lead to non-compliant issues and increase operational/security risks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | 5.15, 5.18 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | 5.15, 8.2, 8.3 | To ensure the confidentiality, integrity and availability of AWS resources from accidental or malicious activity, IAM policies containing full administrative privileges must not be permitted. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | 5.15, 8.3, 8.9 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | 5.15, 5.18 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | 5.16, 5.18 | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| restricted-ssh | 8.21, 8.3 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | 8.8 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | 8.8 | Amazon Inspector scans container images stored in Amazon Elastic Container Registry (Amazon ECR) for software vulnerabilities to generate package vulnerability findings. When you activate Amazon Inspector scans for Amazon ECR, you set Amazon Inspector as your preferred scanning service for your private registry. This replaces basic scanning, which is provided at no charge by Amazon ECR, with enhanced scanning, which is provided and billed through Amazon Inspector. Enhanced scanning gives you the benefit of vulnerability scanning for both operating system and programming language packages at the registry level. You can review findings | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | discovered using enhanced scanning at the image level, for each layer of the image, on the Amazon ECR console. Additionally, you can review and work with these findings in other services not available for basic scanning findings, including AWS Security Hub and Amazon EventBridge. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-code-scan-enabled | 8.8 | Amazon Inspector Lambda code scanning scans the custom application code within an AWS Lambda function for code vulnerabilities based on AWS security best practices. Lambda code scanning can detect injection flaws, data leaks, weak cryptography, or missing encryption in your code. This feature is available in specific AWS Regions only. You can activate Lambda code scanning together with Lambda standard scanning (see Inspector.4 Amazon Inspector Lambda standard scanning should be enabled). | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | 8.8, 8.9 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| iotsitewise-asset-model-tagged | 5.9 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | 8.24 | Server-side encryption is a feature in Amazon Data Firehose delivery streams that automatically encrypts data before its at rest by using a key created in AWS Key Management Service (AWS KMS). Data is encrypted before its written to the Data Firehose stream storage layer, and decrypted after its retrieved from storage. This allows you to comply with regulatory requirements and enhance the security of your data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| kinesis-stream-encrypted | 8.24 | Ensuring encryption is enabled for Kinesis data streams at rest reduces the likelihood of unintentional data exposure and reduces the risk of a data breach. Server side encryption is available in Kineses to perform this function. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-key-policy-no-public-access | 8.24, 8.3, 8.9 | A publicly accessible AWS KMS key policy allows principals outside your organization to use the key for cryptographic operations, which can lead to unauthorized decryption of protected data or unsanctioned encryption. Restricting the key policy to specific trusted principals enforces least privilege and protects the confidentiality of data encrypted with the key. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | 8.16, 8.9 | AWS X-Ray can provide tracing and monitoring capabilities for AWS Lambda functions, which can save time and effort debugging and operating Lambda functions. It can help you diagnose errors and identify performance bottlenecks, slowdowns, and timeouts by breaking down latency for Lambda functions. It can also help with data privacy and compliance requirements. If you enable active tracing for a Lambda function, X-Ray provides a holistic view of data flow and processing within the Lambda function, which can help you identify potential security vulnerabilities or non-compliant data handling practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | This visibility can help you maintain data integrity, confident iality, and complianc e with relevant regulations. | |
| mq-auto-minor-vers ion-upgrade-enabled | 8.9 | As Amazon MQ releases and supports new broker engine versions, the changes are backward-compatible with an existing application and dont deprecate existing functiona lity. Automatic broker engine version updates protect you against security risks, help fix bugs, and improve functionality. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| mq-cloudwatch-audit-log-enabled | 8.15, 8.9 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| mq-rabbit-deployment-mode | 5.30, 8.14 | Cluster deployment provides high availability for Amazon RabbitMQ brokers in an AWS Region. The cluster deployment ensures that data is replicated to all nodes in the cluster, which can reduce downtime and loss of data in the event of a failure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | 8.20, 8.22 | By default, clients can access an Amazon MSK cluster only if theyre in the same VPC as the cluster. All communication between Kafka clients and an MSK cluster are private by default and streaming data doesnt traverse the internet. However, if an MSK cluster is configured to allow public access, anyone on the internet can establish a connectio n to Apache Kafka brokers that are running within the cluster. This can lead to issues such as unauthorized access, data breaches, or exploitation of vulnerabilities. If you restrict access to a cluster by requiring authentication and authorization measures, you can help protect sensitive information and | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central) . Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | maintain the integrity of your resources. | |
| msk-connect-connector-logging-enabled | 8.15 | Enabling logging for an Amazon MSK connector captures operational and error events needed to detect anomalous behavior, troubleshoot failures, and support security investigations. Without connector logs, malicious or erroneous activity can go unnoticed and forensic analysis is limited. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-in-cluster-node-require-tls | 8.24 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulat e network traffic. Encrypting data in transit also reduces the risk of unauthori zed access and data loss. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| neptune-cluster-cl oudwatch-log-expor t-enabled | 5.28, 8.15, 8.16 | Configuring Amazon Neptune DB clusters to publish log data (audit and/or slow-query) to a log group in Amazon CloudWatch Logs can facilitate real-time analysis of the log data, and CloudWatc h can be leveraged to create alarms, view metrics, and store log records in highly durable storage. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-public-prohibited | 5.15, 5.33, 8.12, 8.3 | Amazon Neptune DB cluster manual snapshot should be set to private. A public unencrypted manual snapshot is available to all AWS accounts. Public snapshots may result in unintended data exposure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-deletion-protection-enabled | 8.20, 8.32 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that enables you to inspect and filter traffic to, from, or between the Virtual Private Clouds (VPCs). The deletion protection setting protects against accidental deletion of the firewall. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| netfw-policy-rule-group-associated | 8.20, 8.22 | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-stateless-rule-group-not-empty | 8.23 | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | 8.23, 8.9 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewalls subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-encrypted-at-rest | 8.24 | Configuring encryption at rest for OpenSearch is crucial to ensure the security and confidentiality of your data. By encrypting data at rest, you protect it from unauthorized access and potential breaches, mitigating the risk of data exposure. This essential security measure helps maintain compliance with industry standards and regulations, building trust with users and safeguarding your organization's reputation. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | 8.14 | Configuring at least three dedicated primary (master) nodes for an Amazon OpenSearch Service domain provides quorum for cluster management and prevents split-bra in conditions during node failures. This improves the stability and availability of the domain and reduces the risk of cluster-wide outages that disrupt logging and search workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-update-check | 8.8, 8.9 | Configuring the latest updates for Amazon OpenSearch service domains helps to improve security, optimize performance, maintain compatibility with other systems, and address known bugs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | 8.15 | Publishing Aurora PostgreSQL logs to Amazon CloudWatch Logs centralizes database activity for monitoring, alerting, and long-term retention. This supports detection of unauthorized access and anomalous queries, preserves audit trails independently of the database instance, and helps meet logging and compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-auto-minor-version-upgrade-enable | 5.22 | Keeping Amazon Relational Database Service (RDS) clusters up-to-date with the latest minor database engine version ensures timely application of security patches and bug fixes released by AWS. This reduces the possible risk of known vulnerabilities being exploited and maintains a secure and stable database environment. | Available in all commercial Regions except US West (N. California), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-multi-az-enabled | 8.14 | Configuring RDS DB clusters for multiple availability zones (AZ) ensures the availability of data stored in RDS clusters in the event of an AZ outage, or during regular maintenance. Multi-AZ on RDS provides redundancy and automated failover, allowing businesses to maintain operation s of their critical applications and services. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-db-security-group-not-allowed | 8.20, 8.22, 8.23, 8.3 | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. This includes blocking traffic to and from 0.0.0.0/0. | Available only in US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-enhanced-monitoring-enabled | 8.16 | With enhanced monitoring, DB instances can be monitored in real time, to provide metrics and visibility on the processes or threads that use the CPU, memory disk, network usage, as well as details about processes running in the instance. These detailed metrics are useful for detection of abnormal operation of the instance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-instance-public-access-check | 8.22 | Blocking public access to RDS instances helps keep data safe from unauthorized access, reduces the risk of malicious activities, and prevents unnecessary threats. In addition, and if publicly exposed, any brute force attempts logins will lower the database performance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | 8.24 | Data in transit refers to data that moves from one location to another, such as between nodes in a DB cluster or between a DB cluster and a client application. Data can move across the internet or within a private network. Encrypting data in transit reduces the risk of unauthorized users eavesdropping on network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | 8.24 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your applicati on. Data may move across the internet or within a private network. Encryptin g data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | 8.15 | Publishing Amazon RDS for PostgreSQL logs to CloudWatch Logs centralizes database activity for monitoring, alerting, and long-term retention. This supports detection of unauthorized or anomalous database activity, preserves audit trails independently of the instance, and helps satisfy logging and compliance requirements. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgres-instance-encrypted-in-transit | 8.24 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | 8.24 | Data in transit refers to data that moves from one location to another, such as between nodes in a DB cluster or between a DB cluster and a client application. Data can move across the internet or within a private network. Encrypting data in transit reduces the risk of unauthorized users eavesdropping on network traffic. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-configuration-check | 8.24 | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-kms-enabled | 8.24 | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | 8.14 | Enabling Multi-AZ deployment for an Amazon Redshift cluster maintains a standby in a second Availability Zone and fails over automatically if an AZ becomes impaired. This improves the availability and resilience of the data warehouse and reduces the risk of data unavailability during infrastructure failures. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-subnet-group-multi-az | 8.14 | Configuring a Redshift cluster subnet group with subnets in more than one Availability Zone allows the cluster to be provisioned or recovered across AZs. This improves availability and resilience and reduces the risk that a single AZ disruption makes the data warehouse unavailable. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | 8.15 | If you configure Amazon Redshift Serverless to export connection log (connectionlog) and user log (userlog) data to a log group in Amazon CloudWatch Logs, you can collect and store your log records in durable storage, which can support security, access, and availability reviews and audits. With CloudWatch Logs, you can also perform real-time analysis of log data and use CloudWatch to create alarms and review metrics. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-serverless-workgroup-encrypted-in-transit | 8.9 | An Amazon Redshift Serverless workgroup is a collection of compute resources that groups together compute resources like RPUs, VPC subnet groups, and security groups. Properties of a workgroup include network and security settings. These settings specify whether connections to a workgroup should be required to use SSL to encrypt data in transit. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| redshift-serverless-workgroup-no-public-access | 8.22, 8.3 | When a Redshift Serverless workgroup is publicly accessible, its endpoint can be reached from the internet, increasing the risk of unauthorized access and data exfiltration. Disabling public access restricts connectivity to your VPC and trusted networks, reducing the attack surface of the data warehouse. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | 8.20, 8.22 | If enhanced VPC routing is disabled for an Amazon Redshift Serverless workgroup, Amazon Redshift routes traffic through the internet, including traffic to other services within the AWS network. If you enable enhanced VPC routing for a workgroup, Amazon Redshift forces all COPY and UNLOAD traffic between your cluster and your data repositories through your virtual private cloud (VPC) based on the Amazon VPC service. With enhanced VPC routing, you can use standard VPC features to control the flow of data between your Amazon Redshift cluster and other resources. This includes features such as VPC security groups and endpoint | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | policies, network access control lists (ACLs), and Domain Name System (DNS) servers. You can also use VPC flow logs to monitor COPY and UNLOAD traffic. | |
| redshift-unrestricted-port-access | 5.33, 8.20, 8.22, 8.3 | Permitting unrestricted inbound access to the Redshift cluster port (IP address with a /0 suffix) can result in unauthorized access or security incidents. We recommend applying the principal of least privilege access when creating security groups and configuring inbound rules. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | 8.5 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| route53-query-logging-enabled | 8.15 | Enabling logging includes information such as the domain or subdomain that was queried, the date and time of the query, the DNS record type, and the DNS response code. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-default-lock-enabled | 5.33, 8.9 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-read-prohibited | 8.21, 8.22 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-write-prohibited | 8.21, 8.22 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-replication-enabled | 5.30, 8.13, 8.14 | Enabling S3 cross-region replication is crucial for ensuring data availability, durability, and compliance. It helps protect against data loss, regional outages, and provides a mechanism for disaster recovery. By replicating data to a different region, organizations can maintain business continuity and meet regulatory requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-server-side-encryption-enabled | 8.24 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encryption-kms | 8.24 | Protecting objects in S3 using encryption at rest with KMS prevents unauthorized access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-lifecycle-policy-check | 8.10 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-version-lifecycle-policy-check | 8.10 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-config-prod-instance-count | 8.14 | Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architect ure. High availabil ity helps you to recover from security incidents. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-kms-key-configured | 8.24 | Sensitive information can be stored on the storage volumes attached to Amazon SageMaker notebook instance. Amazon KMS key ensures that the data at rest is encrypted. Encryption of data-at-rest is a recommended best practice to add a layer of access management around your data. In case of any compromise to your SageMaker resources, encryption-at-rest ensures that you data is protected from unintended access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | 8.9 | Configuring Service Catalog products as organization shared allows for centralized governance and consistent provisioning across accounts. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ssm-automation-block-public-sharing | 5.10, 5.15, 5.33, 8.3 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | 8.15 | SSM Automation is an AWS Systems Manager tool that helps you build automated solutions to deploy, configure, and manage AWS resources at scale using predefined or custom runbooks. To meet operational or security requirements for your organization, you might need to provide a record of the scripts that it runs. You can configure SSM Automation to send the output from aws:executeScript actions in your runbooks to an Amazon CloudWatch Logs log group that you specify. With CloudWatch Logs, you can monitor, store, and access log files from various AWS services. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-resources-protected-by-backup-plan | 5.30, 8.13 | Ensuring AWS Storage Gateway volumes and file shares are included in a backup plan allows for recovery of data in the event of loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| transfer-connector-logging-enabled | 8.15 | Enabling CloudWatch logging for an AWS Transfer Family connector records file-transfer activity and errors that are essential for monitoring, troubleshooting, and investigating unauthorized or anomalous transfers. Without these logs, malicious activity can go undetected and forensic analysis is limited. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | 8.24 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | 8.20, 8.22, 8.3 | Security groups provide stateful filtering of ingress and egress network traffic to AWS resources. We recommend that no security group allow unrestricted ingress access to remote server administration ports, such as SSH to port 22 and RDP to port 3389, using either the TDP (6), UDP (17), or ALL (-1) protocols. Permitting public access to these ports increases resource attack surface and the risk of resource compromise. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-logging-enabled | 8.15 | Enabling AWS WAF web ACL logging helps monitor and analyze the traffic to web applications, detect any suspicious activity, and identify potential attacks. AWS WAF web ACLs logs can additionally be leveraged for data analysis and reporting purposes, such as identifying trends in traffic patterns, analyzing the effectiveness of security policies, and gaining security insights and behavior. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-root-volume-encryption-enabled | 8.24 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | 8.24 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

## ISO/IEC 42001:2023

This AWS Config managed conformance pack provides a curated mapping between ISO/IEC 42001:2023 (Artificial Intelligence Management Systems) and AWS managed Config rules. It covers Annex A groups A.4 (Resources for AI systems), A.5 (Assessing impacts of AI systems), A.6 (AI system life cycle), A.7 (Data for AI systems), and A.9 (Use of AI systems). Each Config rule applies to a specific AWS resource and relates to one or more ISO 42001 Annex A controls. An Annex A control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**Source identifier:** ISO-42001_2023

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 258 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| access-keys-rotated | A.9.2 | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. | in the AWS GovCloud (US) Regions. |
| account-part-of-organizations | A.4.2 | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| acm-certificate-expiration-check | A.4.3 | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-http-to-https-redirection-check | A.4.3 | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-waf-enabled | A.9.2 | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| api-gw-associated-with-waf | A.9.2 | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | A.4.3 | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| api-gw-execution-logging-enabled | A.6.2.8 | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| api-gw-ssl-enabled | A.4.3 | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-associated-with-waf | A.9.2 | AWS WAF enables you to configure rules that allow, block, or monitor web requests based on customizable rules. Associating a web ACL with your AWS AppSync GraphQL APIs helps protect the AI application endpoints against adversarial and malicious requests. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | A.4.3 | To help protect data at rest, ensure encryption is enabled for Amazon Athena workgroup query results. Because AI dataset query results can be sensitive, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| athena-workgroup-logging-enabled | A.6.2.8 | Enabling logging (metrics and query publication) for Amazon Athena workgroups captures a record of query activity. Logging supports security monitoring of queries against AI datasets. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-global-database-encryption-at-rest | A.4.3 | To help protect data at rest, ensure encryption is enabled for your Amazon Aurora global databases. Because sensitive AI data can exist at rest across the primary and secondary Regions of a global database, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| aurora-mysql-cluster-audit-logging | A.6.2.8 | Enabling audit logging for Amazon Aurora MySQL clusters captures a record of database activity. Audit logs support security monitoring and forensics for AI data infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-resources-protected-by-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-group-elb-healthcheck-required | A.4.5, A.6.2.5 | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-public-ip-disabled | A.4.5, A.9.2 | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| autoscaling-multiple-az | A.6.2.6 | Configuring Amazon EC2 Auto Scaling groups to span multiple Availability Zones improves the availability of the AI compute fleet if an Availability Zone becomes impaired. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| backup-plan-min-frequency-and-min-retention-check | A.6.2.6 | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-encrypted | A.4.3 | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| backup-recovery-point-manual-deletion-disabled | A.6.2.6 | Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-minimum-retention-check | A.6.2.6 | To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| beanstalk-enhanced-health-reporting-enabled | A.4.5, A.6.2.5 | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-browsercustom-network-mode-not-public | A.4.5, A.9.2 | Ensure Amazon Bedrock AgentCore custom browser tools do not operate in a public network mode. Preventing public network access limits exposure of the browser tools used by AI agents. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-browsercustom-recording-enabled | A.6.2.8 | Enabling recording for Amazon Bedrock AgentCore custom browser tools captures a record of agent browser activity. Recording supports auditing and monitoring of AI agent behavior in production. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-codeinterpreter-networkmode-check | A.4.5, A.9.2 | Ensure Amazon Bedrock AgentCore code interpreters run in a restricted network mode. Restricting the network mode limits the ability of code executed by an AI agent to reach external networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-gateway-authorizer-enabled | A.9.2 | Ensure Amazon Bedrock AgentCore gateways have an authorizer configured. Requiring an authorizer enforces authentication and access control on the gateways serving AI agent interactions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| bedrockagentcore-runtime-private-network-required | A.4.5, A.9.2 | Manage access to AI inference by ensuring Amazon Bedrock AgentCore runtimes operate on a private network rather than with public network access. Private networking prevents public exposure of AI agent inference endpoints. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| bedrock-agentcore-memory-encryption-enabled | A.4.3 | To help protect data at rest, ensure Amazon Bedrock AgentCore Memory is encrypted with a customer managed AWS Key Management Service (KMS) key. Because agent conversation and context data can be sensitive, enable encryption to help protect that data. | Available only in US East (N. Virginia), US East (Ohio), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrock-agentcore-memory-event-expiry-duration | A.4.3 | Configuring an event expiry duration for Amazon Bedrock AgentCore Memory limits how long agent memory records are retained. Enforcing retention limits supports data minimization for AI agent context data. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrock-data-source-encryption-enabled | A.4.3 | To help protect data at rest, ensure your Amazon Bedrock knowledge base data sources are encrypted with a customer managed AWS Key Management Service (KMS) key. Because retrieval-augmente d generation (RAG) data can be sensitive , enable encryption to help protect that data. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| clb-multiple-az | A.6.2.6 | Configuring Classic Load Balancers to span multiple Availability Zones improves the availabil ity of the AI services they front. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-associated-with-waf | A.9.2 | AWS WAF enables you to configure rules that allow, block, or monitor web requests based on customizable rules. Associating a web ACL with your Amazon CloudFront distributions helps protect the AI application content delivery layer against adversarial and malicious requests. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudtrail-s3-dataevents-enabled | A.6.2.8 | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-security-trail-enabled | A.6.2.8 | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | A.6.2.6 | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudwatch-alarm-action-enabled-check | A.6.2.6 | Amazon CloudWatch alarms only perform actions when the alarm actions are enabled. Ensuring alarm actions are enabled keeps monitoring and response mechanisms active for AI system health and security metrics. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cloudwatch-log-group-encrypted | A.4.3 | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloud-trail-cloud-watch-logs-enabled | A.6.2.8 | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | A.6.2.8 | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloud-trail-encryption-enabled | A.4.3 | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-log-file-validation-enabled | A.6.2.8 | Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cmk-backing-key-rotation-enabled | A.4.3 | Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-artifact-encryption | A.4.3 | To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild artifacts. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-envvar-awscred-check | A.4.5 | Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cognito-user-pool-advanced-security-enabled | A.9.2 | Amazon Cognito advanced security features detect and respond to compromised credentials and suspicious sign-in activity. Enabling advanced security on user pools helps protect access to AI applications from account takeover. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cognito-user-pool-mfa-enabled | A.9.2 | Multi-factor authentication (MFA) adds a layer of protection on top of a user name and password. Enabling MFA on Amazon Cognito user pools reduces the incidents of compromised accounts for the end users who authentic ate to AI applications. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cognito-user-pool-password-policy-check | A.9.2 | A strong password policy helps prevent credential-based attacks. Ensuring Amazon Cognito user pools enforce minimum complexit y requirements strengthens authentic ation for the users of AI applications. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cw-loggroup-retention-period-check | A.6.2.8 | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| db-instance-backup-enabled | A.6.2.6 | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-instance-multi-az-enabled | A.7.5 | Deploying AWS Database Migration Service (DMS) replication instances across multiple Availability Zones improves resilience. Multi-AZ deployment helps maintain the availability of AI data migration pipelines. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| dms-replication-not-public | A.7.5 | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-autoscaling-enabled | A.6.2.6 | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-in-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-pitr-enabled | A.7.5 | Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-resources-protected-by-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon DynamoDB resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| dynamodb-table-encrypted-kms | A.4.3 | Ensure that encryptio n is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-throughput-limit-check | A.6.2.6 | Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-in-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-optimized-instance | A.4.5, A.6.2.5 | An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-protected-by-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-snapshot-block-public-access | A.4.3, A.9.2 | Manage access to the AWS Cloud by ensuring EBS snapshots cannot be publicly shared at the account level. EBS snapshots of AI compute volumes can contain sensitive data and access control is required. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ebs-snapshot-public-restorable-check | A.4.3, A.9.2 | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| ec2-ebs-encryption-by-default | A.4.3 | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-imdsv2-check | A.9.2 | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-detailed-monitoring-enabled | A.6.2.6 | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-managed-by-systems-manager | A.4.5, A.6.2.5 | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-no-public-ip | A.4.5, A.9.2 | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-profile-attached | A.9.2 | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-public-ip-disabled | A.4.5, A.9.2 | Ensure Amazon EC2 launch templates do not assign public IP addresses to network interfaces. Preventin g public IP assignmen t keeps AI compute instances from being reachable from the internet. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-association-compliance-status-check | A.4.5, A.6.2.5 | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-patch-compliance-status-check | A.4.5, A.6.2.5 | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-protected-by-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ec2-security-group-attached-to-eni | A.4.5, A.9.2 | Ensure security groups are attached to Amazon EC2 elastic network interfaces. Properly attached security groups enforce network access controls on AI compute resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-stopped-instance | A.4.5, A.6.2.5 | Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-volume-inuse-check | A.4.5, A.6.2.5 | This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-logging-enabled | A.6.2.8 | Enabling logging for Amazon EC2 VPN connections captures a record of tunnel activity. VPN logs support monitoring of the network paths carrying AI workload traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| ecs-containers-non privileged | A.9.2 | To assist with implementing the principle of least privilege, Amazon Elastic Container Service (Amazon ECS) task definitio ns should not have elevated privilege enabled. When this parameter is true, the container is given elevated privileges on the host container instance (similar to the root user). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-containers-readonly-access | A.9.2 | Enabling read only access to Amazon Elastic Container Service (ECS) containers can assist in adhering to the principal of least privilege. This option can reduces attack vectors as the container instance's filesystem cannot be modified unless it has explicit read-write permissions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ecs-container-insights-enabled | A.6.2.6 | Amazon CloudWatch Container Insights collects, aggregates, and summarizes metrics and logs from your containerized applications. Enabling Container Insights for Amazon ECS clusters supports operational monitoring of containerized AI services. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-user-for-host-mode-check | A.9.2 | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-automatic-backups-enabled | A.6.2.6 | Enabling automatic backups for Amazon EFS file systems supports recovery of shared AI training data. Automatic backups help protect against data loss. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-encrypted-check | A.4.3 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-in-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-logging-enabled | A.6.2.8 | Amazon EKS control plane logging streams audit and diagnostic logs from the Kubernetes control plane to Amazon CloudWatch Logs. Enabling control plane logging supports security auditing and incident identification for Kubernetes-based AI workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | A.4.3 | To help protect data at rest, ensure envelope encryption of Kubernetes secrets is enabled for your Amazon EKS clusters. Because sensitive credentials for AI workloads can exist in Kubernetes secrets, enable encryptio n with AWS Key Management Service (KMS) to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| eks-endpoint-no-pu blic-access | A.4.3, A.9.2 | Manage access to the AWS Cloud by ensuring the Amazon EKS cluster Kubernetes API server endpoint is not publicly accessible. A private endpoint keeps control of clusters hosting AI workloads within your network boundary. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-rbac-auth-enabled | A.9.2 | Role-based access control (RBAC) authentication restricts access to Amazon ElastiCache clusters to authorized identities. Enabling RBAC authentication supports least-privilege access to the caching layer used by AI inference pipelines. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-redis-cluster-automatic-backup-check | A.6.2.6 | When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup. | Available in all commercial Regions except Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-auto-failover-enabled | A.6.2.6 | Automatic failover for Amazon ElastiCache replication groups promotes a replica to primary if the primary node fails. Enabling automatic failover improves the availability of the caching layer serving AI workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-at-rest | A.4.3 | To help protect data at rest, ensure encryption at rest is enabled for your Amazon ElastiCache replication groups. Because sensitive AI feature data can exist at rest in ElastiCache, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-in-transit | A.4.3 | To help protect data in transit, ensure encryption in transit is enabled for your Amazon ElastiCache replication groups. Because sensitive AI feature data moves between clients and cache nodes, enable in-transit encryption to protect it from interception. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-encrypted-at-rest | A.4.3 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elasticsearch-in-vpc-only | A.4.5, A.9.2 | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-logs-to-cloudwatch | A.6.2.8 | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elasticsearch-node-to-node-encryption-check | A.4.3 | Ensure node-to-node encryptio n for Amazon OpenSearch Service is enabled. Node-to-node encryptio n enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-managed-updates-enabled | A.4.5, A.6.2.5 | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-acm-certificate-required | A.4.3 | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-acm-certificate-required | A.4.3 | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |
| elb-cross-zone-load-balancing-enabled | A.6.2.6 | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-deletion-protection-enabled | A.6.2.6 | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elb-logging-enabled | A.6.2.8 | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | A.4.3 | Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-kerberos-enabled | A.9.2 | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | information about each principal. | |
| emr-master-no-public-ip | A.4.5, A.9.2 | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| encrypted-volumes | A.4.3 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-resources-protected-by-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-job-logging-enabled | A.6.2.8 | Enabling logging for AWS Glue jobs captures a record of data pipeline execution. Job logs support auditing and troubleshooting of AI data preprocessing pipelines. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-ml-transform-encrypted-at-rest | A.4.3 | To help protect data at rest, ensure encryption is enabled for AWS Glue machine learning transforms. Because AI data preparati on can involve sensitive data, enable encryption to help protect that data. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |
| guardduty-ec2-protection-runtime-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty EC2 Runtime Monitoring detects threats to Amazon EC2 instances by observing runtime behavior. Enabling this protection helps identify unauthorized or malicious activity on the compute instances that run AI training and inference workloads. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty ECS Runtime Monitoring detects threats to Amazon ECS tasks, including Fargate, by observing runtime behavior. Enabling this protection helps identify malicious activity in containerized AI inference and training tasks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| guardduty-eks-protection-audit-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious activity in your Amazon EKS clusters. Enabling this protection helps detect threats against Kubernetes clusters hosting AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty EKS Runtime Monitoring detects threats to Amazon EKS workloads by observing container runtime behavior with automated agent management. Enabling this protection helps identify malicious activity in containerized AI services on Kubernetes. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| guardduty-enabled-centralized | A.6.2.6, A.9.4 | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty Lambda Protection monitors network activity from AWS Lambda functions to detect potential threats. Enabling this protection helps identify malicious behavior in serverless AI inference functions . | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| guardduty-malware-protection-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty Malware Protection scans Amazon EBS volumes attached to your compute to detect malicious files. Enabling malware protection helps identify threats to the infrastructure hosting AI training and inference before they can compromise data integrity or availability. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-non-archived-findings | A.6.2.6, A.9.4 | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty RDS Protection analyzes login activity to your Amazon Aurora databases to detect anomalous access. Enabling this protection helps detect suspicious access to databases supporting AI applications and feature stores. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| guardduty-runtime-monitoring-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty Runtime Monitoring observes operating-system-level behavior on your compute resources to detect threats at runtime. Enabling runtime monitoring provides visibility into malicious activity within the environments running AI workloads. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | A.6.2.6, A.9.4 | Amazon GuardDuty S3 Protection monitors object-level API operations to identify potential security risks for data within your Amazon S3 buckets. Enabling this protection helps detect anomalous access to the buckets that hold AI training data and model artifacts, supporting continuous threat detection across the AI workload. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-customer-policy-blocked-kms-actions | A.4.3 | AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-external-access-analyzer-enabled | A.9.2 | AWS Identity and Access Management (IAM) Access Analyzer identifies resources in your organizat ion and accounts that are shared with an external entity. Enabling an external access analyzer helps detect unintende d access to the resources that hold AI data and models. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| iam-group-has-users-check | A.9.2 | AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-inline-policy-blocked-kms-actions | A.4.3 | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iam-no-inline-policy-check | A.9.2 | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | A.9.2 | The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | A.9.2 | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | A.9.2 | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | A.9.2 | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-group-membership-check | A.9.2 | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-mfa-enabled | A.9.2 | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | A.9.2 | This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | A.9.2 | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (CIS Standard value: 45). The actual value should reflect your organization's policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-ssh | A.4.5, A.9.2 | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| inspector-ec2-scan-enabled | A.6.2.6, A.9.4 | Amazon Inspector EC2 scanning continuously assesses Amazon EC2 instances for software vulnerabilities and unintended network exposure. Enabling scanning helps ensure the compute hosting AI training and inference is free of known vulnerabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| inspector-lambda-code-scan-enabled | A.6.2.6, A.9.4 | Amazon Inspector Lambda code scanning analyzes the custom application code in your AWS Lambda functions for vulnerabilities. Enabling code scanning helps identify insecure code in Lambda-based AI inference pipelines. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| inspector-lambda-standard-scan-enabled | A.6.2.6, A.9.4 | Amazon Inspector Lambda standard scanning assesses the dependencies of your AWS Lambda functions for known software vulnerabilities. Enabling standard scanning helps ensure Lambda-based AI workloads do not run vulnerable packages. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instances-in-vpc | A.4.5, A.9.2 | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| internet-gateway-authorized-vpc-only | A.4.5, A.9.2 | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | A.6.2.6 | Ensure Amazon Kinesis data streams retain records for an adequate period. Sufficient retention supports recovery and reprocessing of AI inference and telemetry data. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-stream-encrypted | A.4.3 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-cmk-not-scheduled-for-deletion | A.4.3 | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | A.4.3 | Manage access to encryption keys in the AWS Cloud by ensuring AWS Key Management Service (KMS) key policies do not allow public access. Public access to a KMS key can allow unintended decryption of the AI data and model artifacts the key protects. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| lambda-dlq-check | A.4.5, A.6.2.5 | Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-public-access-prohibited | A.4.3, A.9.2 | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-inside-vpc | A.4.5, A.9.2 | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints.<br>To properly manage access, AWS Lambda functions should be assigned to a VPC. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| macie-auto-sensitive-data-discovery-check | A.7.3, A.7.5 | Amazon Macie automated sensitive data discovery continually evaluates your Amazon S3 estate to identify buckets that contain sensitive data such as personally identifia ble information. Enabling automated discovery helps identify and classify sensitive data used in AI training datasets, supporting data governance obligatio ns. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | A.9.2 | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| multi-region-cloudtrail-enabled | A.6.2.8 | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-deletion-protection-enabled | A.6.2.6 | Enabling deletion protection on AWS Network Firewall firewalls prevents accidental or unauthorized removal of the network protection safeguarding AI workloads. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| netfw-logging-enabled | A.6.2.8 | AWS Network Firewall logging captures flow and alert information for traffic inspected by the firewall. Enabling logging supports network-layer incident identification and forensics for self-hosted AI workloads. | Available in all commercial Regions except Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-multi-az-enabled | A.9.2 | Deploying AWS Network Firewall across multiple Availability Zones helps maintain network protection and availability for AI workloads if an Availability Zone becomes impaired. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-default-action-fragment-packets | A.9.2 | AWS Network Firewall stateless default actions for fragmented packets determine how the firewall handles fragmented traffic that does not match a rule. Configuring an appropriate default action (for example, drop) helps enforce network-layer safety for AI workload traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-policy-default-action-full-packets | A.9.2 | AWS Network Firewall stateless default actions for full packets determine how the firewall handles traffic that does not match a rule. Configuring an appropriate default action (for example, drop) helps enforce network-layer safety for AI workload traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-rule-group-associated | A.9.2 | An AWS Network Firewall policy defines how your firewall monitors and handles traffic in an Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows, and you define default traffic handling. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | A.9.2 | An AWS Network Firewall rule group contains rules that define how your firewall processes traffic in your VPC. An empty stateless rule group when present in a firewall policy does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | A.9.2 | Enabling subnet change protection on AWS Network Firewall prevents unauthorized changes to the subnets the firewall protects, helping maintain consistent network isolation for AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| nlb-cross-zone-load-balancing-enabled | A.6.2.6 | Enabling cross-zone load balancing on Network Load Balancers distributes traffic evenly across all registered targets in all Availability Zones, improving the resilience of AI inference endpoints. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | A.4.5, A.9.2 | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| opensearchserverless-collection-description | A.4.2 | Ensure Amazon OpenSearch Serverless collections used for AI vector search have descriptions configured. Descriptions support inventory and governance tracking of AI search resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearchserverless-collection-standbyreplicas-enabled | A.6.2.6 | Enabling standby replicas for Amazon OpenSearch Serverless collections improves availability. Standby replicas help maintain the availability of the vector search used by AI workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-access-control-enabled | A.4.5 | Ensure fine-grained access control is enabled on your Amazon OpenSearch Service domains. Fine-grained access control provides enhanced authorization mechanisms to achieve least-privileged access to Amazon OpenSearch Service domains. It allows for role-based access control to the domain, as well as index, document, and field-level security, support for OpenSearch Service dashboards multi-tenancy, and HTTP basic authentication for OpenSearch Service and Kibana. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-audit-logging-enabled | A.6.2.8 | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | A.6.2.6 | Ensure Amazon OpenSearch Service domains have sufficient data nodes distributed for fault tolerance. Data node fault tolerance improves the availability of the search and vector infrastructure used by AI workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-encrypted-at-rest | A.4.3 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-https-required | A.4.3 | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-in-vpc-only | A.4.5, A.9.2 | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-logs-to-cloudwatch | A.6.2.8 | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-node-to-node-encryption-check | A.4.3 | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | A.6.2.6 | Ensure Amazon OpenSearch Service domains have dedicated primary nodes configured for fault tolerance. Primary node fault tolerance improves the stability of the search infrastructure serving AI applications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-update-check | A.4.5, A.6.2.5 | Ensure Amazon OpenSearch Service domains are running current software versions with available updates applied. Keeping domains up to date maintains security patches for the AI search infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-automatic-minor-version-upgrade-enabled | A.4.5, A.6.2.5 | Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-backup-retention-check | A.6.2.6 | Ensure Amazon Aurora and Amazon RDS clusters retain automated backups for an adequate period. Sufficient backup retention supports recovery of AI application data. | Available in all commercial Regions except Asia Pacific (New Zealand). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-cluster-deletion-protection-enabled | A.6.2.6 | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | A.4.3 | To help protect data at rest, ensure encryption is enabled for your Amazon Aurora and Amazon RDS database clusters. Because sensitive AI data can exist at rest in database clusters, enable encryption to help protect that data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-iam-authentication-enabled | A.9.2 | Enabling AWS Identity and Access Management (IAM) authentication for Amazon Aurora and Amazon RDS clusters replaces password-based access with short-lived tokens. Token-based access supports least-privilege access control for databases supporting AI applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-multi-az-enabled | A.6.2.6 | Deploying Amazon Aurora and Amazon RDS clusters across multiple Availability Zones improves database resilience. Multi-AZ deployment helps maintain the availability of databases supporting AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-enhanced-monitoring-enabled | A.6.2.6 | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-default-admin-check | A.4.5 | As default usernames are public knowledge , changing default usernames can assist in reducing the attack surface for your Amazon Relational Database Service (Amazon RDS) database instance(s). | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-instance-deletion-protection-enabled | A.6.2.6 | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-iam-authentication-enabled | A.9.2 | Enabling AWS Identity and Access Management (IAM) authentication for Amazon RDS instances replaces password-based access with short-lived tokens. Token-based access supports least-privilege access control for databases supporting AI applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-instance-public-access-check | A.4.3, A.9.2 | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-in-backup-plan | A.6.2.6 | To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-logging-enabled | A.6.2.8 | To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-mariadb-instan ce-encrypted-in-tr ansit | A.4.3 | To help protect data in transit, ensure connections to Amazon RDS for MariaDB instances require encryptio n. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-multi-az-support | A.6.2.6 | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | A.4.3 | To help protect data in transit, ensure connections to Amazon RDS for MySQL instances require encryption. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | A.4.3 | To help protect data in transit, ensure connections to Amazon RDS for PostgreSQL instances require encryption. Requiring secure transport protects AI application data, including pgvector stores, as it moves between clients and the database. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| rds-proxy-tls-encryption | A.4.3 | To help protect data in transit, ensure Transport Layer Security (TLS) is required for connections through Amazon RDS Proxy. Requiring TLS protects AI application data as it moves through the proxy to the database. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |
| rds-snapshots-public-prohibited | A.4.3, A.9.2 | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Melbourne), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-snapshot-encrypted | A.4.3 | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-sqlserver-encrypted-in-transit | A.4.3 | To help protect data in transit, ensure connections to Amazon RDS for SQL Server instances require encryption. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | A.4.3 | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-audit-logging-enabled | A.6.2.8 | To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-backup-enabled | A.6.2.6 | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-configuration-check | A.4.5 | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-kms-enabled | A.4.3 | To help protect data at rest, ensure encryption with AWS Key Managemen t Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-maintenancesettings-check | A.4.5, A.6.2.5 | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-cluster-multi-az-enabled | A.6.2.6 | Deploying Amazon Redshift clusters across multiple Availability Zones improves the resilience of the data warehouse. Multi-AZ deployment helps maintain the availability of Redshift clusters used for AI analytics. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-public-access-check | A.4.3, A.9.2 | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-default-admin-check | A.4.5 | As default usernames are public knowledge, changing default usernames can assist in reducing the attack surface for your Amazon Redshift cluster(s). | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-enhanced-vpc-routing-enabled | A.4.5, A.9.2 | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-require-tls-ssl | A.4.3 | Ensure that your Amazon Redshift clusters require TLS/SSL encryptio n to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | A.4.3 | To help protect data in transit, ensure Amazon Redshift Serverless workgroups encrypt connections. In-transit encryption protects AI analytics data as it moves between clients and the workgroup. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | A.4.5, A.9.2 | Ensure Amazon Redshift Serverles s workgroups route traffic within an Amazon Virtual Private Cloud (Amazon VPC). Keeping traffic within the VPC provides network isolation for AI analytics data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| required-tags | A.4.2 | Ensure that AI workload resources carry the tags you specify so they can be inventoried and classified. Consisten t tagging enables an inventory of AI systems with their risk tier, intended use, and data sensitivity, supporting governanc e and accountability. You can specify up to six required tag keys. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | A.4.5, A.9.2 | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | A.9.2 | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | A.9.2 | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | A.4.3, A.9.2 | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | A.4.3, A.9.2 | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | A.6.2.8 | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-policy-grantee-check | A.4.3, A.9.2 | Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-read-prohibited | A.4.3, A.9.2 | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-write-prohibited | A.4.3, A.9.2 | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-replication-enabled | A.7.5 | Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-server-side-encryption-enabled | A.4.3 | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-ssl-requests-only | A.4.3 | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | A.7.5 | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Adding multi factor authentication (MFA) delete to an S3 bucket requires an additional factor of authentication in order to change the version state of your bucket or to delete and object version. MFA delete can add an additional layer of security in the event security credentials are compromised or unauthorized access is granted. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-default-encryption-kms | A.4.3 | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-event-notifications-enabled | A.7.5 | Amazon S3 event notifications can alert relevant personnel of any accidental or intentional modifications on your bucket objects. Example alerts include: new object is creation, object removal, object restoration, lost and replicated objects. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | A.6.2.6 | Ensure Amazon S3 buckets are included in an AWS Backup plan. Backup coverage supports recovery of the training data and model artifacts stored in Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-version-lifecycle-policy-check | A.7.5 | Ensure Amazon S3 lifecycle policies are configured to help define actions that you want Amazon S3 to take during an object's lifetime (for example, transition objects to another storage class, archive them, or delete them after a specified period of time). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-data-quality-job-encrypt-in-transit | A.4.3 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker data quality job definitions. This protects the integrity of data quality evaluations for AI training data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | A.4.5, A.9.2 | Manage access to the AWS Cloud by ensuring Amazon SageMaker domains use a customer owned Amazon Virtual Private Cloud (Amazon VPC) for non-EFS traffic. VPC-only access provides network isolation for the AI development and deployment environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-configuration-kms-key-configured | A.4.3 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| sagemaker-endpoint-config-prod-instance-count | A.6.2.6 | Configuring an Amazon SageMaker production endpoint with more than one instance improves the availability and resilience of AI inference services. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-bias-job-encrypt-in-transit | A.4.3 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker model bias job definitions. This protects the integrity and confidentiality of fairness assessmen ts for AI models. Note: this rule validates encryption of bias jobs, not that bias monitoring is enabled. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-bias-job-isolation | A.5.2, A.5.4 | Ensure Amazon SageMaker model bias job definitions have network isolation enabled. Network isolation protects the fairness assessment process for AI models. Note: this rule validates isolation of bias jobs, not that bias monitoring is enabled. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-explainability-job-encrypt-in-transit | A.4.3 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker model explainability job definitions. This protects the integrity of model interpretability evaluations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | A.4.5, A.9.2 | Deploy Amazon SageMaker models within an Amazon Virtual Private Cloud (Amazon VPC) to provide network isolation for AI model component s. VPC deployment keeps model traffic within your network boundary. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | A.4.5, A.9.2 | Enabling network isolation on Amazon SageMaker models prevents the model container from making outbound network calls. Network isolation reduces the risk of data exfiltration from AI model components. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-inside-vpc | A.4.5, A.9.2 | Manage access to the AWS Cloud by ensuring Amazon SageMaker notebook instances are deployed within an Amazon Virtual Private Cloud (Amazon VPC). Deploying notebooks inside a VPC provides network isolation for the AI development environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| sagemaker-notebook-instance-kms-key-configured | A.4.3 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-root-access-check | A.9.2 | Disabling root access on Amazon SageMaker notebook instances helps enforce least privilege by preventing users from gaining administrative control of the AI development environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| sagemaker-notebook-no-direct-internet-access | A.4.5, A.9.2 | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| secretsmanager-rotation-enabled-check | A.9.2 | This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-scheduled-rotation-success-check | A.9.2 | Ensure the most recent scheduled rotation of AWS Secrets Manager secrets completed successfully. Successful rotation keeps the credentials used by AI services fresh and reduces the impact of a compromised secret. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-secret-periodic-rotation | A.9.2 | Ensure AWS Secrets Manager secrets are rotated within a defined period. Regular rotation shortens the time a secret used by AI services is valid and reduces the impact of compromise. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| secretsmanager-secret-unused | A.9.2 | Identify AWS Secrets Manager secrets that have not been accessed within a defined period. Detecting and removing unused secrets reduces the risk from stale credentials associated with retired AI systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-using-cmk | A.4.3 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | A.6.2.6, A.9.4 | AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| shield-advanced-enabled-autorenew | A.9.2 | AWS Shield Advanced provides expanded protection against distributed denial of service (DDoS) attacks. Ensuring Shield Advanced subscriptions are set to auto-renew maintains continuous DDoS protection for AI-serving infrastructure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| shield-drt-access | A.9.2 | AWS Shield Advanced allows you to grant the AWS Shield Response Team (SRT) access to respond to DDoS events on your behalf. Configuring SRT access supports timely incident response for AI-facing infrastructure under attack. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-encrypted-kms | A.4.3 | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ssm-document-not-public | A.4.5, A.9.2 | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| subnet-auto-assign-public-ip-disabled | A.4.5, A.9.2 | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-default-security-group-closed | A.4.5, A.9.2 | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-endpoint-enabl ed | A.4.5, A.9.2 | Ensure the AWS services used by AI workloads are reached through Amazon VPC endpoints rather than the public internet. VPC endpoints keep service traffic within the AWS network, reducing exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | A.6.2.8 | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | A.4.5, A.9.2 | This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-open-only-to-authorized-ports | A.4.5, A.9.2 | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-sg-port-restriction-check | A.4.5, A.9.2 | Ensure security groups do not allow unrestricted incoming traffic (from 0.0.0.0/0 or ::/0) to sensitive ports such as SSH (22) and RDP (3389). Restricting these ports reduces the attack surface of AI infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-vpn-2-tunnels-up | A.4.5, A.9.2 | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-logging-enabled | A.6.2.8 | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| wafv2-rulegroup-logging-enabled | A.6.2.8 | Logging on AWS WAFV2 rule groups captures the details of requests evaluated against the rules. Enabling rule group logging supports detailed threat analysis and forensics for traffic to AI application endpoints . | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| wafv2-rulegroup-not-empty | A.9.2 | To provide effective filtering for AI-facing endpoints, ensure your AWS WAFV2 rule groups contain at least one rule. An empty rule group provides no protection when associated with a web ACL. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-webacl-not-empty | A.9.2 | To protect AI-facing endpoints against adversarial input, ensure your AWS WAFV2 web ACLs contain at least one rule or rule group. An empty web ACL provides no filtering and leaves the protected AI application exposed. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

## NIST AI Risk Management Framework (AI RMF)

This AWS Config managed conformance pack provides a curated mapping between the NIST Artificial Intelligence Risk Management Framework (AI RMF 1.0) and AWS managed Config rules. It covers the technically enforceable subcategories of the GOVERN, MAP, MEASURE, and MANAGE functions. Each Config rule applies to a specific AWS resource and relates to one or more AI RMF subcategories. An AI RMF subcategory can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**Source identifier:** NIST-AI-RMF

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 258 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| access-keys-rotated | MAP 3.4, MEASURE 2.7 | The credentials are audited for authorize d devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromis ed. This rule requires an access key rotation | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | value (Config Default: 90). The actual value should reflect your organization's policies. | in the AWS GovCloud (US) Regions. |
| account-part-of-organizations | GOVERN 1.6 | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| acm-certificate-expiration-check | MAP 2.3, MEASURE 2.10 | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-http-to-https-redirection-check | MAP 2.3, MEASURE 2.10 | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-waf-enabled | MEASURE 2.6 | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| api-gw-associated-with-waf | MEASURE 2.6 | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | MAP 2.3, MEASURE 2.10 | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| api-gw-execution-logging-enabled | GOVERN 4.3, MANAGE 4.1 | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| api-gw-ssl-enabled | MAP 2.3, MEASURE 2.10 | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-associated-with-waf | MEASURE 2.6 | AWS WAF enables you to configure rules that allow, block, or monitor web requests based on customizable rules. Associating a web ACL with your AWS AppSync GraphQL APIs helps protect the AI application endpoints against adversarial and malicious requests. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | MAP 2.3, MEASURE 2.10 | To help protect data at rest, ensure encryption is enabled for Amazon Athena workgroup query results. Because AI dataset query results can be sensitive, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| athena-workgroup-logging-enabled | MANAGE 4.1, MEASURE 2.4 | Enabling logging (metrics and query publication) for Amazon Athena workgroups captures a record of query activity. Logging supports security monitoring of queries against AI datasets. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-global-database-encryption-at-rest | MEASURE 2.10 | To help protect data at rest, ensure encryption is enabled for your Amazon Aurora global databases. Because sensitive AI data can exist at rest across the primary and secondary Regions of a global database, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| aurora-mysql-cluster-audit-logging | MAP 2.3 | Enabling audit logging for Amazon Aurora MySQL clusters captures a record of database activity. Audit logs support security monitoring and forensics for AI data infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-resources-protected-by-backup-plan | MANAGE 2.3 | To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-group-elb-healthcheck-required | MEASURE 2.5 | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-public-ip-disabled | MAP 1.6, MEASURE 2.7 | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| autoscaling-multiple-az | MANAGE 2.2 | Configuring Amazon EC2 Auto Scaling groups to span multiple Availability Zones improves the availability of the AI compute fleet if an Availability Zone becomes impaired. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-plan-min-frequency-and-min-retention-check | GOVERN 1.7, MANAGE 2.3 | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-encrypted | MANAGE 2.3 | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| backup-recovery-point-manual-deletion-disabled | MANAGE 2.3 | Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-minimum-retention-check | MANAGE 2.3 | To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| beanstalk-enhanced-health-reporting-enabled | MANAGE 4.2 | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-browsercustom-network-mode-not-public | MAP 2.2 | Ensure Amazon Bedrock AgentCore custom browser tools do not operate in a public network mode. Preventing public network access limits exposure of the browser tools used by AI agents. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-browsercustom-recording-enabled | MANAGE 4.1, MEASURE 2.4 | Enabling recording for Amazon Bedrock AgentCore custom browser tools captures a record of agent browser activity. Recording supports auditing and monitoring of AI agent behavior in production. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-codeinterpreter-networkmode-check | MAP 2.2, MAP 4.2 | Ensure Amazon Bedrock AgentCore code interpreters run in a restricted network mode. Restricting the network mode limits the ability of code executed by an AI agent to reach external networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrockagentcore-gateway-authorizer-enabled | MANAGE 2.4, MEASURE 2.6 | Ensure Amazon Bedrock AgentCore gateways have an authorizer configured. Requiring an authorizer enforces authentication and access control on the gateways serving AI agent interactions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| bedrockagentcore-runtime-private-network-required | MANAGE 2.4, MEASURE 2.6 | Manage access to AI inference by ensuring Amazon Bedrock AgentCore runtimes operate on a private network rather than with public network access. Private networking prevents public exposure of AI agent inference endpoints. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| bedrock-agentcore-memory-encryption-enabled | MEASURE 2.10 | To help protect data at rest, ensure Amazon Bedrock AgentCore Memory is encrypted with a customer managed AWS Key Management Service (KMS) key. Because agent conversation and context data can be sensitive, enable encryption to help protect that data. | Available only in US East (N. Virginia), US East (Ohio), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrock-agentcore-memory-event-expiry-duration | MANAGE 3.2 | Configuring an event expiry duration for Amazon Bedrock AgentCore Memory limits how long agent memory records are retained. Enforcing retention limits supports data minimization for AI agent context data. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| bedrock-data-source-encryption-enabled | MANAGE 3.1, MAP 2.1, MAP 4.2 | To help protect data at rest, ensure your Amazon Bedrock knowledge base data sources are encrypted with a customer managed AWS Key Management Service (KMS) key. Because retrieval-augmented generation (RAG) data can be sensitive, enable encryption to help protect that data. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| clb-multiple-az | MANAGE 2.2 | Configuring Classic Load Balancers to span multiple Availability Zones improves the availability of the AI services they front. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-associated-with-waf | MEASURE 2.6 | AWS WAF enables you to configure rules that allow, block, or monitor web requests based on customizable rules. Associating a web ACL with your Amazon CloudFront distributions helps protect the AI application content delivery layer against adversarial and malicious requests. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudtrail-s3-dataevents-enabled | GOVERN 4.3, MANAGE 4.1 | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-security-trail-enabled | GOVERN 4.3, MANAGE 4.1 | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | GOVERN 5.2, MANAGE 2.3, MANAGE 3.2, MANAGE 4.1, MEASURE 1.1, MEASURE 2.4, MEASURE 3.1, MEASURE 4.3 | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudwatch-alarm-action-enabled-check | GOVERN 5.2 | Amazon CloudWatch alarms only perform actions when the alarm actions are enabled. Ensuring alarm actions are enabled keeps monitoring and response mechanisms active for AI system health and security metrics. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cloudwatch-log-group-encrypted | MEASURE 2.13 | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloud-trail-cloud-watch-logs-enabled | GOVERN 4.3, MANAGE 4.1 | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | GOVERN 4.3, MANAGE 4.1 | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloud-trail-encryption-enabled | GOVERN 4.3, MANAGE 4.1 | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-log-file-validation-enabled | GOVERN 4.3, MANAGE 4.1 | Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cmk-backing-key-rotation-enabled | MAP 4.2 | Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-artifact-encryption | MAP 2.3, MEASURE 2.10 | To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild artifacts. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-project-envvar-awscred-check | MEASURE 2.7 | Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cognito-user-pool-advanced-security-enabled | MAP 3.4 | Amazon Cognito advanced security features detect and respond to compromised credentials and suspicious sign-in activity. Enabling advanced security on user pools helps protect access to AI applications from account takeover. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-mfa-enabled | MAP 3.4 | Multi-factor authentication (MFA) adds a layer of protection on top of a user name and password. Enabling MFA on Amazon Cognito user pools reduces the incidents of compromised accounts for the end users who authentic ate to AI applications. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cognito-user-pool-password-policy-check | MAP 3.4 | A strong password policy helps prevent credential-based attacks. Ensuring Amazon Cognito user pools enforce minimum complexit y requirements strengthens authentic ation for the users of AI applications. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cw-loggroup-retention-period-check | GOVERN 5.2 | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| db-instance-backup-enabled | MANAGE 2.3 | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-instance-multi-az-enabled | MEASURE 2.5 | Deploying AWS Database Migration Service (DMS) replication instances across multiple Availability Zones improves resilience. Multi-AZ deployment helps maintain the availability of AI data migration pipelines. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| dms-replication-not-public | MAP 1.6, MEASURE 2.7 | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-autoscaling-enabled | MANAGE 2.2 | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-in-backup-plan | MANAGE 2.3 | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-pitr-enabled | GOVERN 1.7 | Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-resources-protected-by-backup-plan | MANAGE 2.3 | To help with data back-up processes, ensure your Amazon DynamoDB resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| dynamodb-table-enc rypted-kms | GOVERN 1.6, MANAGE 3.1, MAP 2.3, MEASURE 2.10 | Ensure that encryptio n is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-throughput-limit-check | MANAGE 2.2 | Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-in-backup-plan | GOVERN 1.7 | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-optimized-instance | MANAGE 4.2 | An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-protected-by-backup-plan | MANAGE 2.3 | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-snapshot-block-public-access | MEASURE 2.7 | Manage access to the AWS Cloud by ensuring EBS snapshots cannot be publicly shared at the account level. EBS snapshots of AI compute volumes can contain sensitive data and access control is required. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-snapshot-public-restorable-check | MEASURE 2.7 | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| ec2-ebs-encryption-by-default | MEASURE 2.10 | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-imdsv2-check | MAP 3.4, MEASURE 2.7 | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-detailed-monitoring-enabled | MANAGE 4.2, MEASURE 2.12 | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-managed-by-systems-manager | MANAGE 4.2 | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-no-public-ip | MAP 1.6, MEASURE 2.7 | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-profile-attached | MEASURE 2.7 | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-public-ip-disabled | MAP 1.6 | Ensure Amazon EC2 launch templates do not assign public IP addresses to network interfaces. Preventin g public IP assignmen t keeps AI compute instances from being reachable from the internet. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-association-compliance-status-check | MANAGE 4.2 | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-patch-compliance-status-check | MANAGE 4.2 | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-protected-by-backup-plan | MANAGE 2.3 | To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ec2-security-group-attached-to-eni | MAP 1.6, MEASURE 2.7 | Ensure security groups are attached to Amazon EC2 elastic network interfaces. Properly attached security groups enforce network access controls on AI compute resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-stopped-instance | MANAGE 4.2 | Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-volume-inuse-check | MANAGE 4.2 | This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-logging-enabled | GOVERN 4.3, MANAGE 4.1 | Enabling logging for Amazon EC2 VPN connections captures a record of tunnel activity. VPN logs support monitoring of the network paths carrying AI workload traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| ecs-containers-non privileged | MEASURE 2.7 | To assist with implementing the principle of least privilege, Amazon Elastic Container Service (Amazon ECS) task definitio ns should not have elevated privilege enabled. When this parameter is true, the container is given elevated privileges on the host container instance (similar to the root user). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ecs-containers-readonly-access | MAP 3.4, MEASURE 2.7 | Enabling read only access to Amazon Elastic Container Service (ECS) containers can assist in adhering to the principal of least privilege. This option can reduces attack vectors as the container instance's filesystem cannot be modified unless it has explicit read-write permissions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ecs-container-insights-enabled | MEASURE 2.4 | Amazon CloudWatch Container Insights collects, aggregates, and summarizes metrics and logs from your containerized applications. Enabling Container Insights for Amazon ECS clusters supports operational monitoring of containerized AI services. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-user-for-host-mode-check | MAP 3.4, MEASURE 2.7 | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-automatic-backups-enabled | GOVERN 1.7 | Enabling automatic backups for Amazon EFS file systems supports recovery of shared AI training data. Automatic backups help protect against data loss. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-encrypted-check | MEASURE 2.10 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-in-backup-plan | MANAGE 2.3 | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-logging-enabled | GOVERN 4.3 | Amazon EKS control plane logging streams audit and diagnostic logs from the Kubernetes control plane to Amazon CloudWatch Logs. Enabling control plane logging supports security auditing and incident identification for Kubernetes-based AI workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| eks-cluster-secrets-encrypted | MAP 4.2 | To help protect data at rest, ensure envelope encryption of Kubernetes secrets is enabled for your Amazon EKS clusters. Because sensitive credentials for AI workloads can exist in Kubernetes secrets, enable encryptio n with AWS Key Management Service (KMS) to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| eks-endpoint-no-pu blic-access | MAP 1.6 | Manage access to the AWS Cloud by ensuring the Amazon EKS cluster Kubernetes API server endpoint is not publicly accessible. A private endpoint keeps control of clusters hosting AI workloads within your network boundary. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-rbac-auth-enabled | MEASURE 2.7 | Role-based access control (RBAC) authentication restricts access to Amazon ElastiCache clusters to authorized identities. Enabling RBAC authentication supports least-privilege access to the caching layer used by AI inference pipelines. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-redis-cluster-automatic-backup-check | MANAGE 2.3 | When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup. | Available in all commercial Regions except Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-auto-failover-enabled | MANAGE 2.2 | Automatic failover for Amazon ElastiCache replication groups promotes a replica to primary if the primary node fails. Enabling automatic failover improves the availability of the caching layer serving AI workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-at-rest | MEASURE 2.10 | To help protect data at rest, ensure encryption at rest is enabled for your Amazon ElastiCache replication groups. Because sensitive AI feature data can exist at rest in ElastiCache, enable encryption to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-in-transit | MAP 4.2, MEASURE 2.10 | To help protect data in transit, ensure encryption in transit is enabled for your Amazon ElastiCache replication groups. Because sensitive AI feature data moves between clients and cache nodes, enable in-transit encryption to protect it from interception. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| elasticsearch-encrypted-at-rest | MAP 2.3, MEASURE 2.10 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elasticsearch-in-vpc-only | MAP 1.6, MEASURE 2.7 | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-logs-to-cloudwatch | GOVERN 4.3, MANAGE 4.1 | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elasticsearch-node-to-node-encryption-check | MAP 2.3, MEASURE 2.10 | Ensure node-to-node encryptio n for Amazon OpenSearch Service is enabled. Node-to-node encryptio n enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-managed-updates-enabled | MANAGE 4.2 | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-acm-certificate-required | MAP 2.3, MEASURE 2.10 | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-acm-certificate-required | MAP 2.3, MEASURE 2.10 | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |
| elb-cross-zone-load-balancing-enabled | MANAGE 2.2 | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-deletion-protection-enabled | MANAGE 2.3 | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elb-logging-enabled | MANAGE 4.1, MEASURE 2.4, MEASURE 4.3 | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | MAP 2.3, MEASURE 2.10 | Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-kerberos-enabled | MAP 3.4, MEASURE 2.7 | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | information about each principal. | |
| emr-master-no-public-ip | MAP 1.6, MEASURE 2.7 | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| encrypted-volumes | MEASURE 2.10 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-resources-protected-by-backup-plan | MANAGE 2.3 | To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-job-logging-enabled | MANAGE 4.1, MAP 2.3 | Enabling logging for AWS Glue jobs captures a record of data pipeline execution. Job logs support auditing and troubleshooting of AI data preprocessing pipelines. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-ml-transform-encrypted-at-rest | MAP 2.3, MEASURE 2.10 | To help protect data at rest, ensure encryption is enabled for AWS Glue machine learning transforms. Because AI data preparati on can involve sensitive data, enable encryption to help protect that data. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |
| guardduty-ec2-protection-runtime-enabled | GOVERN 4.3, MANAGE 4.1, MEASURE 2.6 | Amazon GuardDuty EC2 Runtime Monitoring detects threats to Amazon EC2 instances by observing runtime behavior. Enabling this protection helps identify unauthorized or malicious activity on the compute instances that run AI training and inference workloads. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | GOVERN 4.3, MANAGE 4.1, MEASURE 2.6 | Amazon GuardDuty ECS Runtime Monitoring detects threats to Amazon ECS tasks, including Fargate, by observing runtime behavior. Enabling this protection helps identify malicious activity in containerized AI inference and training tasks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| guardduty-eks-protection-audit-enabled | GOVERN 4.3 | Amazon GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious activity in your Amazon EKS clusters. Enabling this protection helps detect threats against Kubernetes clusters hosting AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | GOVERN 4.3, MEASURE 2.6, MEASURE 3.1 | Amazon GuardDuty EKS Runtime Monitoring detects threats to Amazon EKS workloads by observing container runtime behavior with automated agent management. Enabling this protection helps identify malicious activity in containerized AI services on Kubernetes. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| guardduty-enabled-centralized | GOVERN 4.3, MANAGE 2.3, MEASURE 2.4 | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | GOVERN 4.3, MANAGE 4.1, MEASURE 2.6 | Amazon GuardDuty Lambda Protection monitors network activity from AWS Lambda functions to detect potential threats. Enabling this protection helps identify malicious behavior in serverless AI inference functions . | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| guardduty-malware-protection-enabled | GOVERN 4.3, MANAGE 2.3, MEASURE 2.7, MEASURE 3.1 | Amazon GuardDuty Malware Protection scans Amazon EBS volumes attached to your compute to detect malicious files. Enabling malware protection helps identify threats to the infrastructure hosting AI training and inference before they can compromise data integrity or availability. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-non-archived-findings | GOVERN 4.3, MEASURE 3.1 | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-rds-protection-enabled | GOVERN 4.3, MANAGE 2.3, MEASURE 2.7 | Amazon GuardDuty RDS Protection analyzes login activity to your Amazon Aurora databases to detect anomalous access. Enabling this protection helps detect suspicious access to databases supporting AI applications and feature stores. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| guardduty-runtime-monitoring-enabled | GOVERN 4.3, MANAGE 2.3, MEASURE 2.7 | Amazon GuardDuty Runtime Monitoring observes operating-system-level behavior on your compute resources to detect threats at runtime. Enabling runtime monitoring provides visibility into malicious activity within the environments running AI workloads. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | GOVERN 4.3, MANAGE 2.3, MEASURE 3.1 | Amazon GuardDuty S3 Protection monitors object-level API operations to identify potential security risks for data within your Amazon S3 buckets. Enabling this protection helps detect anomalous access to the buckets that hold AI training data and model artifacts, supporting continuous threat detection across the AI workload. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-customer-policy-blocked-kms-actions | MAP 2.3, MEASURE 2.10 | AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-external-access-analyzer-enabled | MAP 3.4 | AWS Identity and Access Management (IAM) Access Analyzer identifies resources in your organizat ion and accounts that are shared with an external entity. Enabling an external access analyzer helps detect unintende d access to the resources that hold AI data and models. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| iam-group-has-users-check | MAP 3.4, MEASURE 2.7 | AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissio ns or job function is one way to incorpora te least privilege. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-inline-policy-blocked-kms-actions | MAP 2.3, MEASURE 2.10 | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Managemen t Service keys. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegatin g permissions management. This rule allows you to set the blockedAc tionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom) . The actual values should reflect your organization's policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-no-inline-policy-check | MAP 3.4, MEASURE 2.7 | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | MAP 3.4 | The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | MAP 3.4 | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | MAP 3.4, MEASURE 2.7 | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-root-access-key-check | MAP 3.4 | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-group-membership-check | MAP 3.4, MEASURE 2.7 | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iam-user-mfa-enabled | MAP 3.4 | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | MAP 3.4, MEASURE 2.7 | This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | MAP 3.4 | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (CIS Standard value: 45). The actual value should reflect your organization's policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-ssh | MAP 1.6, MEASURE 2.7 | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| inspector-ec2-scan-enabled | GOVERN 4.3, MEASURE 2.7 | Amazon Inspector EC2 scanning continuously assesses Amazon EC2 instances for software vulnerabilities and unintended network exposure. Enabling scanning helps ensure the compute hosting AI training and inference is free of known vulnerabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-code-scan-enabled | GOVERN 4.3, MEASURE 2.7 | Amazon Inspector Lambda code scanning analyzes the custom application code in your AWS Lambda functions for vulnerabilities. Enabling code scanning helps identify insecure code in Lambda-based AI inference pipelines. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| inspector-lambda-standard-scan-enabled | GOVERN 4.3, MEASURE 2.7 | Amazon Inspector Lambda standard scanning assesses the dependencies of your AWS Lambda functions for known software vulnerabilities. Enabling standard scanning helps ensure Lambda-based AI workloads do not run vulnerable packages. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instances-in-vpc | MAP 1.6, MEASURE 2.7 | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| internet-gateway-authorized-vpc-only | MAP 1.6 | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | GOVERN 1.7 | Ensure Amazon Kinesis data streams retain records for an adequate period. Sufficient retention supports recovery and reprocessing of AI inference and telemetry data. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-stream-encrypted | MAP 2.3, MEASURE 2.10 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-cmk-not-scheduled-for-deletion | MAP 4.2 | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | MEASURE 2.7 | Manage access to encryption keys in the AWS Cloud by ensuring AWS Key Management Service (KMS) key policies do not allow public access. Public access to a KMS key can allow unintended decryption of the AI data and model artifacts the key protects. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| lambda-dlq-check | MANAGE 4.2 | Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-public-access-prohibited | MAP 1.6, MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-inside-vpc | MAP 1.6 | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints.<br>To properly manage access, AWS Lambda functions should be assigned to a VPC. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| macie-auto-sensitive-data-discovery-check | GOVERN 4.3, MEASURE 2.10 | Amazon Macie automated sensitive data discovery continually evaluates your Amazon S3 estate to identify buckets that contain sensitive data such as personally identifia ble information. Enabling automated discovery helps identify and classify sensitive data used in AI training datasets, supporting data governance obligatio ns. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | MAP 3.4 | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| multi-region-cloudtrail-enabled | GOVERN 4.3, MANAGE 4.1 | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-deletion-protection-enabled | MANAGE 2.4, MEASURE 2.7 | Enabling deletion protection on AWS Network Firewall firewalls prevents accidental or unauthorized removal of the network protection safeguarding AI workloads. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| netfw-logging-enabled | GOVERN 4.3, MANAGE 4.1 | AWS Network Firewall logging captures flow and alert information for traffic inspected by the firewall. Enabling logging supports network-layer incident identification and forensics for self-hosted AI workloads. | Available in all commercial Regions except Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-multi-az-enabled | MAP 1.6 | Deploying AWS Network Firewall across multiple Availability Zones helps maintain network protection and availability for AI workloads if an Availability Zone becomes impaired. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-default-action-fragment-packets | MEASURE 2.6 | AWS Network Firewall stateless default actions for fragmented packets determine how the firewall handles fragmented traffic that does not match a rule. Configuring an appropriate default action (for example, drop) helps enforce network-layer safety for AI workload traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-policy-default-action-full-packets | MEASURE 2.6 | AWS Network Firewall stateless default actions for full packets determine how the firewall handles traffic that does not match a rule. Configuring an appropriate default action (for example, drop) helps enforce network-layer safety for AI workload traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-rule-group-associated | GOVERN 4.3, MANAGE 2.4 | An AWS Network Firewall policy defines how your firewall monitors and handles traffic in an Amazon VPC. You configure stateless and stateful rule groups to filter packets and traffic flows, and you define default traffic handling. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | MEASURE 2.6 | An AWS Network Firewall rule group contains rules that define how your firewall processes traffic in your VPC. An empty stateless rule group when present in a firewall policy does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | MEASURE 2.7 | Enabling subnet change protection on AWS Network Firewall prevents unauthorized changes to the subnets the firewall protects, helping maintain consistent network isolation for AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| nlb-cross-zone-load-balancing-enabled | MANAGE 2.2 | Enabling cross-zone load balancing on Network Load Balancers distributes traffic evenly across all registered targets in all Availability Zones, improving the resilience of AI inference endpoints. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| no-unrestricted-route-to-igw | MAP 1.6, MEASURE 2.7 | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| opensearchserverless-collection-description | GOVERN 1.6 | Ensure Amazon OpenSearch Serverless collections used for AI vector search have descriptions configured. Descriptions support inventory and governance tracking of AI search resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearchserverless-collection-standbyreplicas-enabled | MEASURE 2.5 | Enabling standby replicas for Amazon OpenSearch Serverless collections improves availability. Standby replicas help maintain the availability of the vector search used by AI workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-access-control-enabled | MEASURE 2.7 | Ensure fine-grained access control is enabled on your Amazon OpenSearch Service domains. Fine-grained access control provides enhanced authorization mechanisms to achieve least-privileged access to Amazon OpenSearch Service domains. It allows for role-based access control to the domain, as well as index, document, and field-level security, support for OpenSearch Service dashboards multi-tenancy, and HTTP basic authentication for OpenSearch Service and Kibana. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-audit-logging-enabled | MANAGE 4.1, MAP 2.3 | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | MANAGE 2.2 | Ensure Amazon OpenSearch Service domains have sufficient data nodes distributed for fault tolerance. Data node fault tolerance improves the availability of the search and vector infrastructure used by AI workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-encrypted-at-rest | MANAGE 3.1, MAP 2.3, MEASURE 2.10 | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-https-required | MAP 4.2, MEASURE 2.10 | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-in-vpc-only | MAP 1.6 | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-logs-to-cloudwatch | MANAGE 4.1, MEASURE 2.4 | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-node-to-node-encryption-check | MAP 4.2, MEASURE 2.7 | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | MANAGE 2.2 | Ensure Amazon OpenSearch Service domains have dedicated primary nodes configured for fault tolerance. Primary node fault tolerance improves the stability of the search infrastructure serving AI applications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-update-check | MANAGE 4.2 | Ensure Amazon OpenSearch Service domains are running current software versions with available updates applied. Keeping domains up to date maintains security patches for the AI search infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-automatic-minor-version-upgrade-enabled | MANAGE 4.2 | Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-backup-retention-check | MANAGE 2.3 | Ensure Amazon Aurora and Amazon RDS clusters retain automated backups for an adequate period. Sufficient backup retention supports recovery of AI application data. | Available in all commercial Regions except Asia Pacific (New Zealand). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-deletion-protection-enabled | GOVERN 1.7 | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | MAP 2.3, MEASURE 2.10 | To help protect data at rest, ensure encryption is enabled for your Amazon Aurora and Amazon RDS database clusters. Because sensitive AI data can exist at rest in database clusters, enable encryption to help protect that data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-iam-authentication-enabled | MAP 4.2 | Enabling AWS Identity and Access Management (IAM) authentication for Amazon Aurora and Amazon RDS clusters replaces password-based access with short-lived tokens. Token-based access supports least-privilege access control for databases supporting AI applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-cluster-multi-az-enabled | MANAGE 2.2 | Deploying Amazon Aurora and Amazon RDS clusters across multiple Availability Zones improves database resilience. Multi-AZ deployment helps maintain the availability of databases supporting AI workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-enhanced-monitoring-enabled | MEASURE 2.4 | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-default-admin-check | MEASURE 2.7 | As default usernames are public knowledge , changing default usernames can assist in reducing the attack surface for your Amazon Relational Database Service (Amazon RDS) database instance(s). | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-instance-deletion-protection-enabled | GOVERN 1.7 | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protectio n enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-iam-authentication-enabled | MEASURE 2.7 | Enabling AWS Identity and Access Management (IAM) authentication for Amazon RDS instances replaces password-based access with short-lived tokens. Token-based access supports least-privilege access control for databases supporting AI applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-instance-public-access-check | MAP 1.6 | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-in-backup-plan | MANAGE 2.3 | To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-logging-enabled | MANAGE 4.1, MAP 2.3, MEASURE 2.4 | To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-mariadb-instan ce-encrypted-in-tr ansit | MEASURE 2.10 | To help protect data in transit, ensure connections to Amazon RDS for MariaDB instances require encryptio n. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-multi-az-support | MANAGE 2.2 | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | MEASURE 2.10 | To help protect data in transit, ensure connections to Amazon RDS for MySQL instances require encryption. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | MEASURE 2.10 | To help protect data in transit, ensure connections to Amazon RDS for PostgreSQL instances require encryption. Requiring secure transport protects AI application data, including pgvector stores, as it moves between clients and the database. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | MEASURE 2.10 | To help protect data in transit, ensure Transport Layer Security (TLS) is required for connections through Amazon RDS Proxy. Requiring TLS protects AI application data as it moves through the proxy to the database. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |
| rds-snapshots-public-prohibited | MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Melbourne), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-snapshot-encrypted | MEASURE 2.10 | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-sqlserver-encrypted-in-transit | MEASURE 2.10 | To help protect data in transit, ensure connections to Amazon RDS for SQL Server instances require encryption. Requiring secure transport protects AI application data as it moves between clients and the database. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | MANAGE 3.1, MAP 2.3, MEASURE 2.10 | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-audit-logging-enabled | MANAGE 4.1, MAP 2.3 | To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-backup-enabled | GOVERN 1.7, MANAGE 2.3 | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-configuration-check | MEASURE 2.7 | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-cluster-kms-enabled | MAP 2.3, MEASURE 2.10 | To help protect data at rest, ensure encryption with AWS Key Managemen t Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-maintenancesettings-check | MANAGE 4.2 | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | MANAGE 2.2 | Deploying Amazon Redshift clusters across multiple Availability Zones improves the resilience of the data warehouse. Multi-AZ deployment helps maintain the availability of Redshift clusters used for AI analytics. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-public-access-check | MAP 1.6, MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-default-admin-check | MEASURE 2.7 | As default usernames are public knowledge, changing default usernames can assist in reducing the attack surface for your Amazon Redshift cluster(s). | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-enhanced-vpc-routing-enabled | MAP 1.6 | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-require-tls-ssl | MAP 4.2, MEASURE 2.10 | Ensure that your Amazon Redshift clusters require TLS/SSL encryptio n to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | MEASURE 2.10 | To help protect data in transit, ensure Amazon Redshift Serverless workgroups encrypt connections. In-transit encryption protects AI analytics data as it moves between clients and the workgroup. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | MEASURE 2.7 | Ensure Amazon Redshift Serverles s workgroups route traffic within an Amazon Virtual Private Cloud (Amazon VPC). Keeping traffic within the VPC provides network isolation for AI analytics data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| required-tags | GOVERN 1.6, MANAGE 3.1, MAP 2.3, MEASURE 2.1 | Ensure that AI workload resources carry the tags you specify so they can be inventoried and classified. Consisten t tagging enables an inventory of AI systems with their risk tier, intended use, and data sensitivity, supporting governanc e and accountability. You can specify up to six required tag keys. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confident iality of systems. This rule allows you to optionall y set blockedPo rt1 - blockedPort5 parameters (Config Defaults: 20,21,338 9,3306,4333). The actual values should reflect your organizat ion's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | MAP 3.4, MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | MAP 3.4, MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | MANAGE 4.1, MAP 2.3, MEASURE 2.4 | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-policy-grantee-check | MEASURE 2.7 | Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-read-prohibited | MEASURE 2.10 | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-public-write-prohibited | MEASURE 2.10 | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-replication-enabled | MAP 2.3 | Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-server-side-encryption-enabled | MANAGE 3.1, MAP 2.3, MAP 4.2, MEASURE 2.1, MEASURE 2.10 | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-ssl-requests-only | MAP 2.3, MEASURE 2.10 | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | GOVERN 1.7, MANAGE 3.1, MAP 2.3, MAP 4.2, MEASURE 2.1 | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Adding multi factor authentication (MFA) delete to an S3 bucket requires an additional factor of authentication in order to change the version state of your bucket or to delete and object version. MFA delete can add an additional layer of security in the event security credentials are compromised or unauthorized access is granted. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-default-encryption-kms | MEASURE 2.10 | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-event-notifications-enabled | MAP 2.3 | Amazon S3 event notifications can alert relevant personnel of any accidental or intentional modifications on your bucket objects. Example alerts include: new object is creation, object removal, object restoration, lost and replicated objects. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | MANAGE 2.3 | Ensure Amazon S3 buckets are included in an AWS Backup plan. Backup coverage supports recovery of the training data and model artifacts stored in Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-version-lifecycle-policy-check | MAP 2.3 | Ensure Amazon S3 lifecycle policies are configured to help define actions that you want Amazon S3 to take during an object's lifetime (for example, transition objects to another storage class, archive them, or delete them after a specified period of time). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-data-quality-job-encrypt-in-transit | MAP 2.3, MEASURE 2.1 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker data quality job definitions. This protects the integrity of data quality evaluations for AI training data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | MAP 1.6 | Manage access to the AWS Cloud by ensuring Amazon SageMaker domains use a customer owned Amazon Virtual Private Cloud (Amazon VPC) for non-EFS traffic. VPC-only access provides network isolation for the AI developme nt and deployment environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-configuration-kms-key-configured | GOVERN 1.7, MANAGE 2.2, MANAGE 4.2, MEASURE 1.1 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| sagemaker-endpoint-config-prod-instance-count | MANAGE 2.2, MANAGE 3.2, MEASURE 4.3 | Configuring an Amazon SageMaker production endpoint with more than one instance improves the availability and resilience of AI inference services. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-bias-job-encrypt-in-transit | MAP 2.3, MEASURE 2.11 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker model bias job definitions. This protects the integrity and confidentiality of fairness assessmen ts for AI models. Note: this rule validates encryption of bias jobs, not that bias monitoring is enabled. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-bias-job-isolation | MAP 4.2, MEASURE 2.11 | Ensure Amazon SageMaker model bias job definitions have network isolation enabled. Network isolation protects the fairness assessment process for AI models. Note: this rule validates isolation of bias jobs, not that bias monitoring is enabled. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-explainability-job-encrypt-in-transit | MAP 2.3, MEASURE 2.11, MEASURE 2.9 | To help protect data in transit, ensure inter-container traffic is encrypted for Amazon SageMaker model explainability job definitions. This protects the integrity of model interpretability evaluations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | MAP 2.1, MEASURE 2.3 | Deploy Amazon SageMaker models within an Amazon Virtual Private Cloud (Amazon VPC) to provide network isolation for AI model component s. VPC deployment keeps model traffic within your network boundary. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | MANAGE 3.1, MAP 2.1, MAP 4.2, MEASURE 2.5 | Enabling network isolation on Amazon SageMaker models prevents the model container from making outbound network calls. Network isolation reduces the risk of data exfiltration from AI model components. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-inside-vpc | MAP 1.6, MEASURE 2.7 | Manage access to the AWS Cloud by ensuring Amazon SageMaker notebook instances are deployed within an Amazon Virtual Private Cloud (Amazon VPC). Deploying notebooks inside a VPC provides network isolation for the AI development environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| sagemaker-notebook-instance-kms-key-configured | MAP 2.3, MEASURE 2.10 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-root-access-check | MAP 3.4, MEASURE 2.7 | Disabling root access on Amazon SageMaker notebook instances helps enforce least privilege by preventing users from gaining administrative control of the AI development environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| sagemaker-notebook-no-direct-internet-access | MAP 2.2 | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| secretsmanager-rotation-enabled-check | MANAGE 3.1, MAP 3.4, MEASURE 2.10 | This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-scheduled-rotation-success-check | MANAGE 3.1 | Ensure the most recent scheduled rotation of AWS Secrets Manager secrets completed successfully. Successful rotation keeps the credentials used by AI services fresh and reduces the impact of a compromised secret. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-secret-periodic-rotation | MANAGE 3.1 | Ensure AWS Secrets Manager secrets are rotated within a defined period. Regular rotation shortens the time a secret used by AI services is valid and reduces the impact of compromise. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| secretsmanager-secret-unused | MAP 3.4 | Identify AWS Secrets Manager secrets that have not been accessed within a defined period. Detecting and removing unused secrets reduces the risk from stale credentials associated with retired AI systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-using-cmk | MAP 3.4, MEASURE 2.10 | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | GOVERN 4.3, MEASURE 1.2 | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| shield-advanced-enabled-autorenew | MEASURE 2.6 | AWS Shield Advanced provides expanded protection against distributed denial of service (DDoS) attacks. Ensuring Shield Advanced subscriptions are set to auto-renew maintains continuous DDoS protection for AI-serving infrastructure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| shield-drt-access | MEASURE 2.6 | AWS Shield Advanced allows you to grant the AWS Shield Response Team (SRT) access to respond to DDoS events on your behalf. Configuring SRT access supports timely incident response for AI-facing infrastructure under attack. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| sns-encrypted-kms | GOVERN 5.2 | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ssm-document-not-public | MAP 1.6, MEASURE 2.7 | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| subnet-auto-assign-public-ip-disabled | MAP 1.6, MEASURE 2.7 | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-default-security-group-closed | MAP 1.6 | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-endpoint-enabl ed | MAP 1.6, MEASURE 2.7 | Ensure the AWS services used by AI workloads are reached through Amazon VPC endpoints rather than the public internet. VPC endpoints keep service traffic within the AWS network, reducing exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | MANAGE 4.1 | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | MAP 1.6, MEASURE 2.7 | This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| vpc-sg-open-only-to-authorized-ports | MANAGE 2.4, MEASURE 2.7 | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-sg-port-restriction-check | MAP 1.6, MEASURE 2.7 | Ensure security groups do not allow unrestricted incoming traffic (from 0.0.0.0/0 or ::/0) to sensitive ports such as SSH (22) and RDP (3389). Restricting these ports reduces the attack surface of AI infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-vpn-2-tunnels-up | MAP 1.6, MEASURE 2.7 | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-logging-enabled | GOVERN 4.3, MANAGE 4.1, MEASURE 2.7 | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-logging-enabled | MANAGE 4.1 | Logging on AWS WAFV2 rule groups captures the details of requests evaluated against the rules. Enabling rule group logging supports detailed threat analysis and forensics for traffic to AI application endpoints . | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| wafv2-rulegroup-not-empty | MEASURE 2.7 | To provide effective filtering for AI-facing endpoints, ensure your AWS WAFV2 rule groups contain at least one rule. An empty rule group provides no protectio n when associated with a web ACL. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-webacl-not-empty | MANAGE 2.4, MEASURE 2.6, MEASURE 2.7 | To protect AI-facing endpoints against adversarial input, ensure your AWS WAFV2 web ACLs contain at least one rule or rule group. An empty web ACL provides no filtering and leaves the protected AI application exposed. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

## NIST SP 800-171 Rev. 2

This AWS Config managed conformance pack provides a curated mapping between the National Institute of Standards and Technology (NIST) Special Publication 800-171 Revision 2 requirements and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more NIST SP 800-171 requirements. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** NIST-SP-800-171_R2

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 254 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| acm-certificate-expiration-check | 3.13.15 | Expired certificates could allow malicious actors to impersonate legitimate entities, potentially leading to data breaches or other security incidents. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-internal-scheme-check | 3.13.6 | Internal scheme configuration for Application Load Balancers is critical for maintaining network security boundaries and implementing | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. This configura tion helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requireme nts that mandate network segmentat ion and controlled access to application infrastructure. | (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-listener-tagged | 3.4.1 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibility and enable automated resource lifecycle management through tag-based policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | 3.4.1 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | 3.13.2 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | 3.3.1 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | 3.4.1 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| api-gw-ssl-enabled | 3.13.15 | Use SSL certificates with API Gateway to provide an additional layer of security. With this configuration, API Gateway authenticates HTTP requests and allows only those originating from API Gateway to access backend systems, even if the backend is publicly accessible. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | 3.4.1 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | 3.4.1 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | 3.4.1 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | 3.4.3 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | 3.4.1 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | 3.4.1 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-freeform-profile-config-storage | 3.4.2 | Storing configuration data in approved AWS services ensures proper security controls, encryption, access management, and audit capabilities. AWS Secrets Manager provides automatic encryption, rotation capabilities, and fine-grained access controls for sensitive configuration data. AWS AppConfig hosted configuration store offers integrated security features and simplified management within the AppConfig service. Using unapproved storage locations may expose configuration data to security risks, lack proper encryption, or bypass organizational governance controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | 3.4.1 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | 3.4.1 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | 3.13.1, 3.13.6 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | 3.4.1 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | 3.4.1 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | 3.13.8 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | 3.4.2 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | 3.4.1 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | 3.13.8 | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | 3.4.2 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | 3.4.1 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | 3.4.1 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | 3.4.1 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| apprunner-service-in-vpc | 3.1.3, 3.13.1, 3.13.6 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | 3.13.1 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appstream-fleet-in-vpc | 3.1.3, 3.13.1 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configuration supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | 3.13.16 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | 3.13.8 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | 3.13.16 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | 3.14.6, 3.3.1 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | 3.3.1 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | 3.13.16 | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | 3.4.2 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | 3.14.1 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | 3.3.1, 3.3.2 | Audit logs track and monitor system activities. They provide a record of events that can help you detect security breaches, investigate incidents, and comply with regulations. Audit logs also enhance the overall accountability and transparency of your organization. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| aurora-mysql-cluster-audit-logging | 3.3.1, 3.3.2, 3.3.8, 3.3.9 | Database logs can assist with security and access audits and help diagnose availability issues. Audit logs capture a record of database activity, including login attempts, data modifications, schema changes, and other events that can be audited for security and compliance purposes. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-public-ip-disabled | 3.13.6 | By disabling public IP assignment, the attack surface for EC2 instances launched via ASGs, the attack surface is reduced by prohibiting direct internet access. Instead, place EC2 instances in private VPC subnets and enforce access through the associated load balancer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-enabled | 3.4.2 | Enabled Batch compute environments are essential for maintaining operational continuity and ensuring that batch processing workloads can execute as expected. Disabled compute environments prevent job queues from launching instances and processing jobs, which can lead to application failures, delayed data processing, and potential business impact. Monitoring the enabled state helps detect unintended configuration changes that could disrupt critical batch processing operations and ensures that compute resources remain available for scheduled and on-demand workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | 3.4.2 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | vulnerabilities or operational issues. | |
| cloudfront-custom-ssl-certificate | 3.13.15 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | 3.13.15, 3.13.8, 3.4.7 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | 3.1.3, 3.1.5, 3.13.1 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | 3.3.1, 3.3.2 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for read data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | if you configure a multi-Region trail that logs read-only or all types of data events for all S3 buckets. | |
| cloudtrail-all-write-s3-data-event-check | 3.3.1, 3.3.2 | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-bucket-access-logging | 3.3.1, 3.3.2 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudtrail-s3-bucket-public-access-prohibited | 3.13.1 | Protecting CloudTrail logs from public access is essential for maintaining the security of audit data. Public exposure of audit logs could reveal sensitive information about your infrastructure and operations. Implementing strict access controls prevents unauthorized access to critical security information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-security-trail-enabled | 3.3.1 | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudwatch-alarm-action-check | 3.14.6, 3.14.7, 3.3.4 | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-log-group-encrypted | 3.3.8 | Although the CloudWatch Log groups are encrypted by default using SSE (Server Side encryption), encrypting Amazon CloudWatch logs with KMS keys enhances the security and protection of sensitive log data. Encrypting logs at rest ensures if unauthorized individuals gain access to the underlying storage infrastructure, they will not be able to read the log data without the encryption key. Encrypting CloudWatch logs provides an additional layer of defense and assists with preventing unauthorized modification or tampering of log data, ensuring the integrity and reliability of the logs for auditing, troublesh | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| datasync-task-data-verification-enabled | 3.8.9 | Data verification in DataSync tasks is critical for ensuring data integrity during transfer operation s. When enabled, DataSync performs additional checksums and validation to verify that data has been accuratel y transferred from source to destinati on. This helps detect potential data corruption, incomplete transfers , or transmission errors that could compromise data quality. Without verification, organizat ions may unknowing ly have corrupted or incomplete data in their destination systems, which could lead to application failures, data loss, or compliance violation s in regulated environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-task-logging-enabled | 3.3.1, 3.3.2 | Audit logs track and monitor system activities. They provide a record of events that can help you detect security breaches, investigate incidents, and comply with regulations. Audit logs also enhance the overall accountability and transparency of your organization. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| dax-tls-endpoint-encryption | 3.13.8 | HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. You should only allow encrypted connections over TLS to access DAX clusters. However, encrypting data in transit can affect performance. You should test your application with encryption turned on to understand the performance profile and the impact of TLS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | 3.4.1 | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | accountability across database migration projects. | |
| dms-mongo-db-authentication-enabled | 3.1.1 | Enabling authentication for MongoDB endpoints is critical for maintaining data security during migrations. Without proper authentication, unauthorized access to sensitive data could occur. Implementing password-based authentication helps protect MongoDB data stores from unauthorized access and potential data breaches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-neptune-iam-authorization-enabled | 3.1.1, 3.1.2, 3.1.5 | IAM authentication for Neptune endpoints provides robust, scalable access control. Without IAM authentication, managing access to Neptune databases during migrations could be less secure and more complex. Implementing IAM authorization ensures fine-grained control over who can access Neptune data through DMS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-redis-tls-enabled | 3.13.8 | TLS provides end-to-end security when data is sent between applications or databases over the internet. When you configure SSL encryption for your DMS endpoint, it enables encrypted communication between the source and target databases during the migration process. This helps prevent eavesdropping and interception of sensitive data by malicious actors. Without SSL encryption, sensitive data may be accessed, resulting in data breaches, data loss, or other security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-sourcedb-logging | 3.3.1, 3.3.3 | Proper logging of DMS replication tasks is crucial for maintaining operational visibility and ensuring data integrity. Without adequate logging, issues in the replication process might go undetected, potentially leading to data inconsistencies. Configuring appropriate logging supports efficient troubleshooting and monitoring of migration processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-tagged | 3.4.1 | Proper tagging of DMS replication tasks enables effective resource management, cost allocation, and governance. Tags facilitate tracking of migration projects, identifying resource ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into their migration activities and cannot effectively manage costs or apply security policies across their DMS infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted | 3.13.16 | Encrypting Amazon DocumentDB clusters at rest protects sensitive data from unauthorized access if storage is compromised. Without encryption, data stored in DocumentDB clusters remains vulnerable to unauthorized access through direct storage access. Encryption at rest is a critical data protection control that helps meet compliance requirements for sensitive workloads and prevents data breaches by ensuring all cluster data remains encrypted across all storage components. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | 3.13.8 | Encryption in transit protects sensitive data as it moves between DocumentDB clients and clusters, preventing unauthorized interception and eavesdropping on database communications. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transmission. Enabling TLS encryption ensures that database credentials, queries, and results remain confidential and maintain integrity during network transmission. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-in-logically-air-gapped-vault | 3.13.5 | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| ebs-snapshot-public-restorable-check | 3.1.5 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | 3.4.1 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | 3.4.1 | Proper tagging of EC2 carrier gateways is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize track network infrastructure components, implement automated governance policies, maintain compliance with organizational standards. Consistent tagging practices facilitate resource identification, billing attribution, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-connection-log-enabled | 3.1.12, 3.1.20 | Enabling logging captures connection details, facilitating monitoring, auditing, and troubleshooting of Client VPN activities and potential security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | 3.4.1 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | 3.1.3, 3.13.1, 3.13.4, 3.13.6 | Source/destination checking for Amazon EC2 instances and attached ENIs should be enabled and configured consistently across your EC2 instances. Each ENI has its own setting for source/destination checks. If source/destination checking is enabled, Amazon EC2 enforces source/destination address validation, which ensures that an instance is either the source or the destination of any traffic that it receives. This provides an additional layer of network security by preventing resources from handling unintended traffic and preventing IP address spoofing. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | 3.4.1 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | 3.4.1, 3.4.2 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | 3.1.1, 3.13.15, 3.7.1 | Running resources on supported software versions ensures optimal performance, security, and access to the latest features. Regular updates safeguard against vulnerabilities, which help ensure a stable and efficient user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | 3.7.1 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | 3.4.1 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | 3.13.11, 3.13.16, 3.13.6 | For an additional layer of security, you should enable encryption for Amazon EBS volumes. Encryption operations then occur on the servers that host Amazon EC2 instances, which helps ensure the security of both data at rest and data in transit between an instance and its attached EBS storage. Amazon EBS encryption is a straightforward encryption solution for EBS resources associated with your EC2 instances. With EBS encryption, you arent required to build, maintain, and secure your own key management infrastructure. EBS encryption uses AWS KMS keys when creating encrypted volumes. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | 3.4.1 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | 3.3.1, 3.3.2, 3.3.8, 3.3.9 | AWS Site-to-Site VPN logs provide you with deeper visibility into your Site-to-Site VPN deployments. With this feature, you have access to Site-to-Site VPN connection logs that provide details on IP Security (IPsec) tunnel establish ment, Internet Key Exchange (IKE) negotiations, and dead peer detection (DPD) protocol messages. Site-to-Site VPN logs can be published to CloudWatch Logs. This feature provides customers with a single consistent way to access and analyze detailed logs for all of their Site-to-Site VPN connections. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | 3.4.1 | Proper tagging of VPN connections enables effective resource managemen t, cost allocatio n, governance oversight. Tags facilitate automated operations, security policies, complianc e reporting by providing metadata that identifies resource ownership, purpose, environme nt, other critical attributes. Consisten t tagging practices improve operation al visibility support organizational policies for resource lifecycle managemen t. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | 3.4.1 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | 3.4.2 | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | 3.4.1 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | 3.1.3 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-filesystem-ct-encrypted | 3.13.16, 3.13.6 | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryptio n, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | 3.4.1 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). |---|---|---|---|
| | | that require encryption of data in transit. | |
| elb-acm-certificate-required | 3.13.8 | Encrypt data in transit to maintain the confidentiality and integrity of data as it traverses public and unsecured networks and reduce the risk of unauthorized access to data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | 3.13.1 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | 3.4.1 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | 3.13.15, 3.13.8 | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-master-no-public-ip | 3.13.6 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | 3.13.16 | Encryption at rest for Amazon EMR clusters protects sensitive data stored on cluster instances from unauthorized access. This control helps ensure compliance with data protection regulations and security best practices by detecting EMR configurations that lack proper encryption settings. Monitoring encryption configuration helps prevent data exposure risks and maintains data confidentiality for big data processing workloads. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | 3.13.1, 3.13.8 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| encrypted-volumes | 3.13.6 | Encrypting data at rest on EBS volumes facilitates protection of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| evidently-launch-tagged | 3.4.1 | Tagging Evidently launches is crucial for maintaining operational visibility and resource management. Proper tagging enables effective resource tracking, cost allocation, and access control. Without structured tagging, organizations may struggle to manage and monitor their feature launches effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |
| evidently-project-tagged | 3.4.1 | Proper tagging of Evidently projects is essential for maintaining project organization and visibility. Tags enable effective resource management, cost tracking, and access control. Without structured tagging, organizations risk losing oversight of their experimentation projects. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-tagged | 3.4.1 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentat ion. Proper tagging enables efficient resource managemen t, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | 3.3.1 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | 3.4.1 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | 3.8.9 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | 3.4.1 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | 3.3.1 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | 3.4.1 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | 3.4.1 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | 3.3.1 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | 3.13.16 | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | 3.14.7 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | 3.12.3, 3.14.6, 3.14.7 | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | visibility in containerized environments meeting compliance requirements for runtime threat detection. | |
| guardduty-eks-protection-audit-enabled | 3.12.3, 3.14.3, 3.14.6 | EKS Audit Log Monitoring is crucial for maintaining security visibility in Kubernetes environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilities for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | 3.12.3, 3.14.3, 3.14.6 | EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | 3.14.6, 3.14.7 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | 3.12.3, 3.14.3, 3.14.6 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Lambda Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Lambda Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | 3.14.2, 3.14.3 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administr ator can enable or disable the Malware Protection feature for the member accounts in the organizat ion. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Malware Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
