| guardduty-rds-protection-enabled | 3.14.2, 3.14.3, 3.14.6 | RDS Protection is crucial for maintaining database security and detecting potential threats. Without this feature, organizations may miss security incidents targeting their database instances. Enabling RDS Protection provides enhanced security monitoring for database environments. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | 3.12.3, 3.14.6, 3.14.7 | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | 3.14.6, 3.14.7 | S3 Protection is essential for maintaining security visibility over storage resources. Without this feature, organizations may miss potential security threats targeting their S3 buckets. Enabling S3 Protection enhances threat detection capabilities for storage environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | 3.4.1 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | 3.5.2, 3.5.7, 3.5.8 | Attackers can launch a brute force attack and retrieve weak passwords if they do not meet specified requirements. Ensure to setup and enforce strong password configura tion requirements to mitigate the risk of password guessing, brute force or dictionary attacks, which could lead to unauthorized access to sensitive data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | 3.1.1, 3.1.2, 3.1.5, 3.1.7, 3.13.3, 3.3.9 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | 3.1.4 | To ensure the confidentiality, integrity and availability of AWS resources from accidental or malicious activity, IAM policies containing full administrative privileges must not be permitted. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | 3.1.1, 3.1.2, 3.1.5, 3.1.7, 3.13.3, 3.13.4, 3.3.8, 3.3.9 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | 3.4.1 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | 3.13.10 | Expired SSL/TLS server certificates left in IAM can be inadvertently associated with resources, causing failed or insecure connections and weakening trust in the certificate chain. Promptly removing expired certificates reduces the risk of outages and of clients negotiating connections with invalid credentials, and keeps the certificate inventory accurate. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | 3.4.1 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-mfa-enabled | 3.5.3, 3.7.5 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | 3.1.1, 3.1.2, 3.1.7, 3.13.3, 3.3.9 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | 3.1.2 | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| restricted-ssh | 3.1.3, 3.13.1 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | 3.11.2 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | 3.11.2, 3.14.5 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | 3.11.2 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | 3.11.2 | Standard Lambda scanning is essential for maintaining security in serverless architectures. Without regular scanning, organizations may miss potential vulnerabilities in their Lambda runtime environments. Implementing standard scanning helps ensure comprehensive Lambda function security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| internet-gateway-authorized-vpc-only | 3.1.3, 3.13.1 | This control provides a mechanism that forces attention on which VPC(s) should be allowed to access the public internet. This control will require the appropriate VPC(s) to be identified and labeled as approved for internet accesses through use of an IGW. Failure to identify and validate the list of authorized VPC's could cause unintended access to AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | 3.4.1 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | 3.4.1 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | 3.4.1 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-gateway-tagged | 3.4.1 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | 3.4.1 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | 3.4.1 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industria l IoT initiatives. Without proper tagging, organizat ions may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | 3.4.1 | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | 3.4.2 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | 3.4.1 | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | 3.1.2, 3.3.1 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | 3.13.16 | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kms-key-policy-no-public-access | 3.1.1, 3.1.5 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | 3.4.1 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | 3.14.7, 3.3.1 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | 3.4.1 | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). | --- | --- | --- | --- |
| lightsail-disk-tagged | 3.4.1 | Proper tagging of Lightsail disks enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support complianc e requirements for asset identification. Without consistent tagging, organizat ions lose visibility into resource utilizati on, struggle with cost attribution, and face challenge s in implement ing automated management workflows. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | 3.1.1 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-single-instance-broker-storage-type-efs | 3.7.1 | Using EFS storage type for Amazon MQ ActiveMQ single-instance brokers provides enhanced durability, availability, and performance characteristics compared to other storage options. EFS offers automatic scaling, built-in redundancy across multiple Availability Zones, and better integration with AWS backup and recovery services. This storage configuration helps ensure message persistence, reduces the risk of data loss during broker failures, and supports better disaster recovery capabilities for messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | 3.3.1 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| mq-cloudwatch-audit-log-enabled | 3.3.1 | By publishing ActiveMQ broker logs to CloudWatch Logs, you can create CloudWatch alarms and metrics that increase the visibility of security-related information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| mq-no-public-access | 3.13.6 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | 3.1.20, 3.1.3, 3.13.6 | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-cluster-tagged | 3.4.1 | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | 3.3.1 | Enabling logging for MSK Connect connectors is essential for operational visibility, troubleshooting, and security monitoring. Logs provide critical insights into connector performance, data processing activities, error conditions, and potential security events. Without proper logging, organizations lose the ability to effectively monitor data pipeline operations, diagnose issues, meet compliance requirements for audit trails, and detect suspicious activities or data processing anomalies. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | 3.1.1, 3.1.5, 3.5.1, 3.5.2 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | 3.3.1, 3.3.2 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nacl-no-unrestricted-ssh-rdp | 3.1.20, 3.1.3, 3.13.1 | Network access control list (NACL) should not allow unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | 3.13.16 | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-logging-enabled | 3.13.1 | Enabling firewall logging for AWS Network Firewall gives detailed information about network traffic, including the time that the stateful engine received a packet flow, detailed information about the packet flow, and any stateful rule action taken against the packet flow. | Available in all commercial Regions except Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-policy-rule-group-associated | 3.1.3, 3.13.1 | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-stateless-rule-group-not-empty | 3.1.14, 3.1.3, 3.13.1, 3.13.6 | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | 3.1.3, 3.13.1, 3.13.6, 3.4.5 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewalls subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | 3.13.1, 3.13.6 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | 3.4.1 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | 3.3.1, 3.3.2 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | 3.4.1 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | 3.1.20, 3.1.3, 3.13.1 | Restricting access to the IGW enhances the security of EC2 instances by protecting sensitive data and reduces the potential for data breaches or unauthorized activities. Restricting access to the IGW aligns with the principle of least privilege and allows for implementation of network segmentation and isolation strategies by controlling outbound connections creating communication boundaries between different parts of network infrastructure reducing the occurrence of lateral movement of threats, limits the impact of potential security incidents, and enhances overall network security and resilience. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | 3.3.1 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | 3.4.1 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-subnet-igw-check | 3.13.5, 3.13.6 | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | 3.13.11, 3.13.8 | Data in transit refers to data that moves from one location to another, such as between nodes in a DB cluster or between a DB cluster and a client application. Data can move across the internet or within a private network. Encrypting data in transit reduces the risk of unauthorized users eavesdropping on network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | 3.13.1, 3.13.8 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your applicati on. Data may move across the internet or within a private network. Encryptin g data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | 3.4.1 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | 3.3.1 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgres-instance-encrypted-in-transit | 3.13.1, 3.13.8 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | 3.13.8 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | 3.13.11, 3.13.8 | Data in transit refers to data that moves from one location to another, such as between nodes in a DB cluster or between a DB cluster and a client application. Data can move across the internet or within a private network. Encrypting data in transit reduces the risk of unauthorized users eavesdropping on network traffic. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | 3.3.1 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | 3.4.2 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | 3.3.1, 3.3.2 | If you configure Amazon Redshift Serverless to export connection log (connectionlog) and user log (userlog) data to a log group in Amazon CloudWatch Logs, you can collect and store your log records in durable storage, which can support security, access, and availability reviews and audits. With CloudWatch Logs, you can also perform real-time analysis of log data and use CloudWatch to create alarms and review metrics. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | 3.13.8, 3.4.2 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | 3.1.3, 3.13.1 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | 3.1.3, 3.13.1, 3.4.2 | Routing Redshift Serverless workgroup traffic through a VPC provides essential network isolation and security controls. VPC routing enables organizations to implement network-level access controls, monitor traffic patterns, and maintain compliance with security frameworks that require private network configurations. This control helps prevent unauthorized external access to data warehouse resources and ensures that sensitive data processing occurs within a controlled network environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-unrestricted-port-access | 3.1.3, 3.13.6 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implementing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | 3.4.1 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | 3.4.1 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | 3.3.1, 3.3.2 | Enabling S3 bucket logging on target S3 buckets allows you to capture all events that might affect objects in a target bucket. Configuring logs to be placed in a separate bucket enables access to log information, which can be useful in security and incident response workflows and provides redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-ssl-requests-only | 3.13.15, 3.13.8 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-tagged | 3.4.1 | Tagging S3 buckets is essential for effective resource management, cost allocation, and governance. Tags enable organizations to categorize buckets by purpose, owner, environment, or project, facilitating accurate cost tracking and billing. Proper tagging also supports automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | 3.3.8 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and applicati on failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanent ly, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encrypt ion-kms | 3.13.11, 3.13.16, 3.8.9 | Protecting objects in S3 using encryptio n at rest with KMS prevents unauthori zed access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-event-notifications-enabled | 3.3.8 | By enabling event notifications in S3 buckets, alerts can be generated when pre-defined behavior occurs. Notifications from S3 buckets can then trigger prompt response to identified threats and reduce the impact of a security incident. Example events include object ACL PUT, object tagging, S3 lifecycle, new object created, object removal, and more. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-in-logically-air-gapped-vault | 3.13.5 | Logical air-gapping is essential for protecting critical S3 data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical S3 bucket data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | 3.13.1 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | 3.4.1 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | 3.4.1 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | 3.13.1 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | 3.13.1 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | 3.4.1 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | 3.1.1 | Portfolio sharing only within Organizations helps ensure that a portfolio isnt shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub recommends using ORGANIZATIONMEMBER ACCOUNT instead of ACCOUNT. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ses-malware-scanning-enabled | 3.14.5 | Malware scanning in SES is crucial for protecting email workflows from potential security threats. Without scanning, malicious attachments or spam could infiltrate your systems. Implementing malware scanning helps maintain email security and prevents potential infections. | Available only in US East (N. Virginia), US West (Oregon), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| sns-encrypted-kms | 3.13.11, 3.13.16 | Encrypting data at rest reduces the risk of data stored on disk being accessed by unauthenticated users. This adds a data protection layer from a threat actor attempting to gain unauthorized access to SNS topic data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | 3.1.1, 3.1.2 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | 3.1.1, 3.1.2, 3.1.5, 3.5.2 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). |---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | 3.1.1, 3.1.2, 3.1.5, 3.5.2 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | 3.3.1, 3.3.2 | SSM Automation is an AWS Systems Manager tool that helps you build automated solutions to deploy, configure, and manage AWS resources at scale using predefined or custom runbooks. To meet operational or security requirements for your organization, you might need to provide a record of the scripts that it runs. You can configure SSM Automation to send the output from aws:executeScript actions in your runbooks to an Amazon CloudWatch Logs log group that you specify. With CloudWatch Logs, you can monitor, store, and access log files from various AWS services. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | 3.4.1 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | 3.8.5, 3.8.9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-resources-in-logically-air-gapped-vault | 3.13.1, 3.13.5 | Logical air-gapping is essential for protecting critical Storage Gateway data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical Storage Gateway volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| transfer-connector-logging-enabled | 3.3.1, 3.3.2 | Enabling CloudWatch logging for an AWS Transfer Family connector records file-transfer activity and errors that are essential for monitoring, troubleshooting, and investigating unauthorized or anomalous transfers. Without these logs, malicious activity can go undetected and forensic analysis is limited. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | 3.13.8 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | 3.13.1, 3.3.1 | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. These logs can be used to respond quickly to anomalous traffic and can aid in incident response investigations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | 3.4.7 | Having unused network Access Control Lists (ACLs) increases the risk of unauthorized access to VPC EC2 resources and should be removed once not needed any longer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-open-only-to-authorized-ports | 3.1.20, 3.1.3, 3.13.1 | High risk ports are often exposed to the Internet and easily exploitable by attackers. Security groups provide stateful filtering of ingress and egress network traffic to AWS. Security group rules should follow the principal of least privileged access. Unrestricted access (IP address with a /0 suffix) increases the opportunity for malicious activity such as hacking, denial-of-service attacks, and loss of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| vpc-sg-port-restriction-check | 3.1.3, 3.13.1, 3.13.6 | Controlling inbound access to sensitive ports is crucial for maintaining network security. Unrestricted access to ports like SSH (22) or RDP (3389) could lead to unauthorized system access and potential breaches. Implementing strict port access controls helps prevent unauthorized access to resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-vpn-2-tunnels-up | 3.1.13, 3.1.20 | Ensuring that both VPN tunnels are up for an AWS Site-to-Site VPN connection is important for confirming a secure and highly available connection between an AWS VPC and your remote network. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-logging-enabled | 3.14.6, 3.14.7 | Enabling Amazon CloudWatch metrics for AWS Web Application Firewall (WAF) V2 rules and rule groups provides visibility into web traffic patterns, potential threats, and WAF enforcement actions. This data supports security monitoring, incident response, and continuous improvement of web application security posture. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | 3.4.1 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-root-volume-encryption-enabled | 3.13.16 | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | 3.13.16 | User volume encryption is crucial for protecting sensitive user data in virtual desktop environments. Without encryption, user files and data could be exposed if storage systems are compromised. Implementing user volume encryption provides necessary protection for end-user data. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | 3.4.1 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## NIST SP 800-53 Rev. 5

This AWS Config managed conformance pack provides a curated mapping between the National Institute of Standards and Technology (NIST) Special Publication 800-53 Revision 5 controls and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more NIST SP 800-53 controls. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** NIST-SP-800-53_R5

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 405 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| acm-certificate-expiration-check | IA-5(5) | Expired certificates could allow malicious actors to impersonate legitimate entities, potentially leading to data breaches or other security incidents. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-http-to-https-redirection-check | SC-8(1) | By forcing redirection from HTTP to the secure HTTPs protocol, data is encrypted in transit in both directions: going to and coming from the origin server to maintain confident | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | iality and prevent malicious actors from unauthorized access to sensitive data such as user credentials. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-internal-scheme-check | SC-7, SC-7(28), SC-7(5) | Internal scheme configuration for Application Load Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. This configura tion helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requireme | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | nts that mandate network segmentat ion and controlled access to application infrastructure. | |
| alb-listener-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environme nts. Tags facilitate automated complianc e reporting, support billing transpare ncy by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibilit y and enable automated resource lifecycle managemen t through tag-based policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-branch-auto-deletion-enabled | SA-15, SA-15(5), SA-8 | Enabling automatic branch deletion prevents the accumulation of orphaned branches in Amplify Hosting that no longer correspond to active Git repository branches. This reduces operational overhead by eliminating manual cleanup tasks, minimizes resource waste from unused hosting environments, and maintains consistency between the Git repository structure and deployed environments. Proper branch lifecycle management also reduces potential security risks from abandoned or forgotten deployment branches that may contain outdated code or configurations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| amplify-app-description | SA-5 | Requiring descriptions for AWS Amplify applications enhances operational visibility and governance by ensuring applications are properly documented. Descriptions provide essential context about application purpose, functionality, and ownership, which facilitates better resource management, troubleshooting, and compliance reporting. This practice supports organizational standards for resource documentation and helps teams quickly identify and understand deployed applications across the environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | SC-28(1) | When caching is enabled, Amazon API Gateway service caches responses from API endpoint, reduces the number of calls made to an API endpoint and improves the latency of requests to the API. In addition, encrypted REST API caches protect data from unauthorized access. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | AU-12, AU-2, AU-3 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-description | SA-5 | Requiring descriptions for AppConfig applications enhances operational visibility and governance by ensuring proper documentation of application purposes and configurations. Well-documented applications improve team collaboration, facilitate troubleshooting, support compliance auditing, and reduce the risk of misconfiguration or unintended changes to critical application settings. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | CM-8 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | CM-8 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | CM-2, CM-6, CM-6(1), SI-6 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-description | SA-5 | Requiring descriptions for AppConfig deployment strategies enhances operational visibility and governance by ensuring deployment approaches are properly documented. Well-documented deployment strategies facilitate team collaboration, reduce configuration errors, and support compliance requirements by providing clear context about how application configurations are rolled out. This documentation becomes critical during incident response, audits, and knowledge transfer activities. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-deployment-strategy-replicate-to-ssm | SA-5 | Replicating AppConfig deployment strategies to Systems Manager documents provides centralized configuration management, enhanced auditability, and improved operational visibility. This practice enables teams to maintain consistent deployment patterns across environments, facilitates compliance reporting by creating auditable records of deployment configurations, and supports disaster recovery scenarios by ensuring deployment strategies are preserved in a managed service with built-in versioning and access controls. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-description | SA-5 | Requiring descriptions for AppConfig environments enhances operational visibility and governance by ensuring proper documentation of configuration management resources. Well-documented environments facilitate troubleshooting, change management, and knowledge transfer among team members. This practice supports compliance requirements for maintaining adequate documentation of system components and helps prevent configuration drift by clearly identifying the purpose and scope of each environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | CM-8 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | CM-8 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-freeform-profile-config-storage | CM-2, CM-3, CM-6 | Storing configuration data in approved AWS services ensures proper security controls, encryption, access management, and audit capabilities. AWS Secrets Manager provides automatic encryption, rotation capabilities, and fine-grained access controls for sensitive configuration data. AWS AppConfig hosted configuration store offers integrated security features and simplified management within the AppConfig service. Using unapproved storage locations may expose configuration data to security risks, lack proper encryption, or bypass organizational governance controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-hosted-configuration-version-description | SA-5 | Requiring descriptions for AppConfig hosted configuration versions enhances operational visibility and change management practices. Meaningful descriptions help teams understand the purpose and impact of configuration changes, facilitate troubleshooting during incidents, and maintain proper audit trails for compliance requirements. This practice reduces the risk of deploying unintended configurations and improves collaboration among development and operations teams by providing clear context for each configuration version. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-description | SA-5 | Requiring descriptions for AppIntegrations event integrations enhances operational visibility and maintainability by ensuring each integration is properly documented. Descriptions help teams understand the purpose, scope, and business context of integrations, which is critical for troubleshooting, change management, and knowledge transfer. Well-documented integrations reduce operational risk, improve incident response times, and support compliance requirements that mandate proper documentation of system components and data flows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | CM-8 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | SC-7, SC-7(5) | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | CM-8 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | CM-8 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | SC-13, SC-8, SC-8(1) | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | CM-6 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | CM-8 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | SC-13, SC-8, SC-8(1) | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | CM-6 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | CM-8 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | CM-8 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | CM-8 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | AC-4, SC-7, SC-7(5) | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | SC-7, SC-7(3) | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | AU-12, AU-2, AU-3 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appstream-fleet-in-vpc | AC-4, SC-7, SC-7(4) | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configura tion supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastru cture. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | SC-13, SC-28, SC-28(1) | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | SC-13, SC-8, SC-8(1) | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | SC-13, SC-28, SC-28(1) | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | SI-4, SI-4(2) | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | AU-12, AU-2, AU-3 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-data-catalog-description | SA-5 | Requiring descriptions for Athena data catalogs enhances data governance by ensuring proper documentation of catalog purposes, contents, and usage guidelines. Well-documented catalogs improve data discoverability, facilitate compliance with data management policies, and enable teams to understand data sources and their intended use cases. This practice supports organizational data stewardship efforts and reduces the risk of data misuse or confusion in analytics workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-prepared-statement-description | SA-5 | Requiring descriptions for Athena prepared statements enhances query management, maintainability, and operational transparency. Documented prepared statements enable teams to understand query purposes, facilitate knowledge transfer, and support effective database governance. This practice reduces operational risks by ensuring that complex or frequently-used queries are properly documented for future reference and troubleshooting. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Europe (Milan), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-description | SA-5 | Requiring descriptions for Athena workgroups enhances operational visibility and governance by ensuring workgroups are properly documented with their intended purpose, usage patterns, and ownership information. Well-documented workgroups improve resource management, facilitate troubleshooting, support compliance auditing, and help teams understand the business context of query workloads. This practice is essential for maintaining organized data analytics environments and ensuring proper resource accountability in multi-team organizations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | SC-28, SC-28(1) | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | CM-2, CM-6 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | MA-2(2), SI-2 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | AU-12, AU-2, AU-3, AU-3(1) | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| aurora-last-backup-recovery-point-created | CP-10(2) | Maintaining backup recovery points enables efficient data restoration and business continuity for Aurora databases in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-mysql-cluster-audit-logging | AU-12, AU-2, AU-3 | Audit logging is essential for maintaining database security and regulatory compliance by providing detailed records of all database activities, including user connections, queries, and administrative actions. This capability enables security teams to detect unauthorized access attempts, investigate potential security incidents, and meet compliance requirements for data governance. Without audit logging, organizations lack visibility into database operations and cannot effectively monitor for suspicious activities or demonstrate compliance with regulatory frameworks that require | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | comprehensive audit trails. | |
| aurora-resources-in-logically-air-gapped-vault | SC-7, SC-7(12), SC-7(21) | Logical air-gapping is essential for protecting critical database systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical database resources. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-resources-protected-by-backup-plan | CP-10(2), CP-9 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-capacity-rebalancing | SC-5(2) | Capacity Rebalancing ensures the availability of Auto Scaling groups by proactively launching additional EC2 Spot Instances when existing instances are at an elevated risk of interruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-group-elb-healthcheck-required | CP-2(2), SI-13(5) | Activating ELB health checks for Auto Scaling groups enables the detection of application-level issues that basic EC2 status checks cannot identify. When an instance fails ELB health checks, Auto Scaling can automatically replace it, maintaining application availability and reducing downtime. Without these enhanced health checks, unhealthy instances might continue serving traffic despite application failures, leading to degraded user experience and potential service disruptions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launchconfig-requires-imdsv2 | SA-8(20) | IMDSv2 is an enhancement to instance metadata access that requires session-oriented requests to add defense in depth against unauthorized metadata access. IMDSv2 requires a PUT request to initiate a session to the instance metadata service and retrieve a token. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| autoscaling-launch-config-public-ip-disabled | SC-7 | By disabling public IP assignment, the attack surface for EC2 instances launched via ASGs, the attack surface is reduced by prohibiting direct internet access. Instead, place EC2 instances in private VPC subnets and enforce access through the associated load balancer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-multiple-az | SI-13(5) | Amazon EC2 Auto Scaling group that spans multiple Availability Zones reduces the chances of total outage of instances should an availability zone become unavailable. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| backup-plan-min-frequency-and-min-retention-check | CP-9 | Data loss can occur if recovery points expire before a defined retention period. By configuring the frequency of backup and retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-encrypted | CP-9(8), SC-28(1) | Encrypting data at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| backup-recovery-point-manual-deletion-disabled | CP-10(6) | A backup vault policy prevents the deletion of backup recovery points and allows you to grant access to users to create and update backup plans and on-demand backups for the resources contained in backup vaults. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-enabled | CM-2, CM-6, CP-2 | Enabled Batch compute environments are essential for maintaining operational continuity and ensuring that batch processing workloads can execute as expected. Disabled compute environments prevent job queues from launching instances and processing jobs, which can lead to application failures, delayed data processing, and potential business impact. Monitoring the enabled state helps detect unintended configuration changes that could disrupt critical batch processing operations and ensures that compute resources remain available for scheduled and on-demand workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | CM-2, CM-3, CM-6 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). | AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | vulnerabilities or operational issues. | |
| clb-multiple-az | SI-13(5) | Deploying AWS ELB's across multiple Availability Zones ensures availability of critical functions in the event of an AZ outage, or during regular maintenance, and allows organizat ions to maintain business operations. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cloudformation-sta ck-notification-check | CM-8(3) | Sending event notifications to an SNS topic allows you to perform real time monitoring of your CloudForm ation stacks and proactively manage the provisioning and update process of AWS resources . CloudFormation stacks event notificat ions help identify unauthorized actions and ensure that AWS resources meet corporate standards and compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Europe (Spain), Israel (Tel Aviv), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-custom-ssl-certificate | SC-8(1) | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-default-root-object-configured | CM-6, SC-7 | Without a default root object configured, requests to the root URL of a CloudFront distribution may expose directory listings or other unintended content. Configuring a default root object ensures that users receive a specific file when accessing the distribution's root URL, reducing the risk of information disclosure and maintaining better control over content delivery. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | SC-13, SC-8, SC-8(1) | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | AC-3, AC-4, CM-6, SC-7 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-traffic-to-origin-encrypted | SC-8(1) | Encrypting traffic between CloudFron t distribution and its custom origin will ensure that the environme nt is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-viewer-policy-https | SC-8(1) | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | AU-12, AU-2, AU-3, AU-3(1) | Logging S3 read operations is crucial for maintaining security visibility and compliance. Without proper logging, organizations cannot track who accessed sensitive data or detect potential security incidents. Complete audit trails of read operation s support security monitoring and incident investiga tion. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-all-write-s3-data-event-check | AU-12, AU-2, AU-3, AU-3(1) | Logging S3 write operations is essential for maintaining data integrity and security compliance. Without proper logging, organizations cannot track changes to sensitive data or investigate potential security incidents. Complete audit trails of write operation s enable effective security monitoring. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-bucket-access-logging | AU-12, AU-2, AU-3, AU-3(1) | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-data events-enabled | AU-4(1) | Logging data events on S3 buckets is an important piece of maintaining the reliability, availabil ity, and performan ce of Amazon S3 and your AWS solutions. Collecting monitoring data for object-level requests supports your Incident Response plan by allowing you to identify potential issues and respond on a timely manner; or to provide valuable data for forensics, auditing, and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-security-trail-enabled | AU-12, AU-3, MA-4(1) | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | AC-2(12), AU-5, AU-5(1), AU-5(2), AU-7(1), CA-7, CA-7(4), CA-7(6), CM-11, CM-11(3), CM-6, CM-6(2), IA-10, SI-4(5) | CloudWatch alarms provide proactive alerting and automated responses to critical events that can maintain system confidentiality, integrity and availability. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudwatch-alarm-action-enabled-check | PM-31, SI-4(5) | CloudWatch Alarms trigger automated notifications and actions when reaching pre-defined thresholds. Disabling CloudWatch alarms will stop continuous monitoring, and delay responses to events affecting critical applications or functions. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-log-group-encrypted | AU-9, AU-9(3), SC-28(1) | Although the CloudWatch Log groups are encrypted by default using SSE (Server Side encryption), encrypting Amazon CloudWatch logs with KMS keys enhances the security and protection of sensitive log data. Encrypting logs at rest ensures if unauthorized individuals gain access to the underlying storage infrastructure, they will not be able to read the log data without the encryption key. Encrypting CloudWatch logs provides an additional layer of defense and assists with preventing unauthorized modification or tampering of log data, ensuring the integrity and reliability of the logs for auditing, troublesh | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | ooting, and forensic analysis purposes. | |
| cloudwatch-metric-stream-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-cloud-watch-logs-enabled | AU-12, AU-3, AU-4(1), AU-9(2), AU-9(7), MA-4(1) | Sending CloudTrail logs to CloudWatch Logs will facilitate real-time and historic activity logging based on user, API, resource, and IP address, and provides opportunity to establish alarms and notifications for anomalous or sensitivity account activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-enabled | AC-6(9), AU-12, AU-2, AU-3, MA-4(1) | Enabling CloudTrail provides essential visibility into your AWS environment by recording API activity and changes, aiding in security monitoring, compliance audits, and troubleshooting incidents. It enhances accountability, enables rapid incident response, and facilitates thorough forensic analysis of events within your cloud infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | AU-9, AU-9(3), SC-28, SC-28(1) | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-log-file-validation-enabled | AU-9 | Enabling log file validation ensures the integrity of CloudTrail log files by digitally signing log files using cryptographic hash functions verifying log data has not been tampered with or modified providing a mechanism to investigate the event, trace its origin, and understand the impact supportin g effective incident response. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| codebuild-project-envvar-awscred-che ck | IA-5(7) | AWS CodeBuild environment variables can be used in the build commands. To reduce the risk of unauthorized access to sensitive informati on, ensure that these are not stored in plain text type. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-encrypted-at-rest | SC-13, SC-28, SC-28(1) | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-auto-rollback-monitor-enabled | CM-2(3), CM-3, CM-3(3) | Auto rollback and monitoring helps ensure service continuity by automatically reverting failed deployments, reducing potential downtime and business impact. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-auto-rollback-enabled | CP-10, CP-9 | Auto rollback configuration in CodeDeploy deployment groups provides critical protection against failed deployments by automatically reverting to the previous working version when deployment failures or alarm thresholds are triggered. This capability minimizes application downtime, reduces the impact of problematic deployments, and ensures service availability. Without auto rollback enabled, failed deployments may require manual intervention to restore service, potentially leading to extended outages and degraded user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | SI-2 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-ec2-minimum-healthy-hosts-configured | CP-2(2), SC-6 | Maintaining a minimum number of healthy hosts during deployments is critical for application availability. Without this safeguard, deployments could potentially disrupt all instances simultaneously, causing service outages. Configuring minimum healthy hosts helps maintain service continuity during updates. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codepipeline-region-fanout-check | CP-6(1) | Deploying applications to multiple regions can improve both latency and availability for your application. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | AC-3, IA-2 | Preventing unauthenticated access to Cognito Identity Pools is critical for maintaining security boundaries and implementing proper access controls. Allowing unauthenticated identities can expose AWS resources to unauthorized users, potentially leading to data breaches, resource abuse, or compliance violations. By monitoring and detecting Identity Pools with unauthenticated access enabled, organizations can ensure that all users are properly authenticated before receiving temporary AWS credentials, supporting defense-in-depth security strategies and regulatory compliance requirements. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-advanced-security-enabled | AC-12, AC-3 | Advanced security features in Cognito user pools are essential for protectin g against unauthori zed access and potential threats. Without these features, user accounts may be more vulnerable to attacks such as credential stuffing or brute force attempts. Enabling advanced security strengthens overall user authentic ation and access control. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | AU-12, AU-2, AU-3, AU-3(1) | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| custom-eventbus-policy-attached | AC-3 | Attaching a resource policy helps control access to custom EventBus resources , enforcing least privilege and reducing the risk of unauthorized access. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| cw-loggroup-retention-period-check | AU-11 | Configuring retention periods for Amazon CloudWatch log groups ensures that data is kept for the required duration, to meet organizational compliance requirements, and allows the review and investigation of suspicious activities. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | SC-13, SC-23, SC-8, SC-8(1), SC-8(2) | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-task-data-verification-enabled | SI-7 | Data verification in DataSync tasks is critical for ensuring data integrity during transfer operation s. When enabled, DataSync performs additional checksums and validation to verify that data has been accuratel y transferred from source to destinati on. This helps detect potential data corruption, incomplete transfers , or transmission errors that could compromise data quality. Without verification, organizat ions may unknowing ly have corrupted or incomplete data in their destination systems, which could lead to application failures, data loss, or compliance violation s in regulated environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-task-logging-enabled | AU-12, AU-2, AU-3, AU-3(1) | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-encryption-enabled | SC-28(1) | Encrypting DynamoDB Accelerator Clusters at rest is essential to safeguard sensitive information and maintain data confidentiality. By employing encryption, organizations can thwart unauthorized access to data, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Spain), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | SC-13, SC-8, SC-8(1) | HTTPS (TLS) can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. You should only allow encrypted connections over TLS to access DAX clusters. However, encrypting data in transit can affect performance. You should test your application with encryption turned on to understand the performance profile and the impact of TLS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| ebs-last-backup-recovery-point-created | CP-9 | Maintaining recent backup recovery points enables efficient data restoration and business continuity for Amazon Elastic Block Store (EBS) volumes in case of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ebs-resources-in-logically-air-gapped-vault | SC-7, SC-7(21) | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-resources-protected-by-backup-plan | CP-10(4), CP-9 | Amazon EC2 backup on AWS involves creating snapshots of your EC2 instances and their attached EBS volumes. These snapshots capture the instance's data at a specific point in time, allowing you to create reliable backups and recover instances in case of data loss or system failures. By utilizing EC2's snapshot and AMI (Amazon Machine Image) features, you can efficiently manage and restore your instances and their data. Not backing up EC2 instances exposes your data to potential loss in the event of hardware failures, accidental deletions, or software errors. Without backups, recovery becomes challenging and time-consuming, risking | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | downtime and data integrity. Regular backups are crucial to mitigate these risks and ensure business continuity. | |
| ebs-snapshot-public-restorable-check | AC-6 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of EC2 carrier gateways is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize track network infrastructure components, implement automated governance policies, maintain compliance with organizational standards. Consistent tagging practices facilitate resource identification, billing attribution, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-not-authorize-all | AC-4, SC-7, SC-7(13), SC-7(21), SC-7(4) | Restricting authorized networks for Amazon VPC Lattice endpoints helps prevent unauthorized access and potential security breaches from untrusted networks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-ebs-encryption-by-default | SC-28(1) | Sensitive data can exist at rest on EBS volumes. All sensitive data should be protected at rest using strong cryptography, to protect the confidentiality and integrity of information and prevent and protect data in storage. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | AC-4, AC-4(17), SC-7, SC-7(11), SC-7(3), SC-7(5) | Source/destination checking for Amazon EC2 instances and attached ENIs should be enabled and configured consistently across your EC2 instances. Each ENI has its own setting for source/destination checks. If source/destination checking is enabled, Amazon EC2 enforces source/destination address validation, which ensures that an instance is either the source or the destination of any traffic that it receives. This provides an additional layer of network security by preventing resources from handling unintended traffic and preventing IP address spoofing. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-imdsv2-check | SA-8(20) | IMDSv2 is an enhancement to instance metadata access that requires session-oriented requests to add defense in depth against unauthori zed metadata access. IMDSv2 requires a PUT request to initiate a session to the instance metadata service and retrieve a token. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | CM-2, CM-3, CM-6 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-managed-by-systems-manager | CM-2(2), CM-3(3), CM-6, CM-6(1), CM-7(3), CM-7(4), CM-7(5), PM-5(1), SI-2(2), SI-2(4), SI-2(5) | Amazon EC2 instances managed by AWS SSM helps maintain security and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-profile-attached | IA-3(4), IA-9 | Attaching IAM profiles to EC2 instances allows you to manage permissio ns and follow the principle of least privilege to prevent unauthorized access to your resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-launch-template-imdsv2-check | SA-8(20), SC-23, SI-2(2) | Running resources on supported software versions ensures optimal performance, security, and access to the latest features. Regular updates safeguard against vulnerabilities, which help ensure a stable and efficient user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-association-compliance-status-check | AC-10, AU-14(1), MA-4 | SSM interactive sessions provide centralized and granular access controls to EC2 instances and enhance reliability along with user attribution in sessions. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | MA-2(2), MA-6(3), SI-2(2), SI-2(4), SI-2(5) | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Network Insights access scopes enables effective resource management, cost allocation, governance across AWS environments. Tags provide essential metadata for tracking resource ownership, purpose, lifecycle management. Consistent tagging practices support automated operations, security policies, compliance reporting requirements. Without adequate tagging, organizations lose visibility into resource utilization patterns struggle to implement effective cost controls access management policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-path-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Network Insights paths enables effective resource management, cost allocation, operational governance. Tags facilitate automated resource discovery, support compliance reporting requirements, enable consistent application of organizational policies across network analysis resources. Without standardized tagging, organizations lose visibility into resource ownership, purpose, associated costs, making it difficult to maintain operational control meet regulatory requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-in-logically-air-gapped-vault | SC-7, SC-7(21) | Logical air-gapping is essential for protecting critical compute resources from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive systems. Implementing air-gapping provides an additional security barrier for critical EC2 instances. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-protected-by-backup-plan | CP-10(4), CP-9 | Amazon EC2 backup on AWS involves creating snapshots of your EC2 instances and their attached EBS volumes. These snapshots capture the instance's data at a specific point in time, allowing you to create reliable backups and recover instances in case of data loss or system failures. By utilizing EC2's snapshot and AMI (Amazon Machine Image) features, you can efficiently manage and restore your instances and their data. Not backing up EC2 instances exposes your data to potential loss in the event of hardware failures, accidental deletions, or software errors. Without backups, recovery becomes challenging and time-consuming, risking | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | downtime and data integrity. Regular backups are crucial to mitigate these risks and ensure business continuity. | |
| ec2-security-group-attached-to-eni | AC-4, SC-7, SC-7(13), SC-7(21), SC-7(4) | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-security-group-attached-to-eni-periodic | AC-4, SC-7, SC-7(13), SC-7(21), SC-7(4) | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | SC-13, SC-28, SC-28(1) | Enabling encryption at rest for EBS volumes attached to EC2 Spot Fleet instances protects sensitive data from unauthorized access helps meet regulatory compliance requirements. Encryption ensures that data stored on EBS volumes is protected both in transit to the storage backend while at rest, reducing the risk of data exposure in case of unauthorized access to the underlying storage infrastructure. This control is particularly important for Spot Fleet instances as they may be terminated recreated frequently, making consistent encryption enforcement critical for maintaining data security across the fleet lifecycle. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-traffic-mirror-session-description | SA-5 | Requiring descriptions for EC2 traffic mirror sessions enhances operational visibility security management by ensuring each session is properly documented with its intended purpose, scope, configuration details. This documentation is critical for security auditing, troubleshooting network issues, compliance reporting, maintaining an organized traffic monitoring infrastructure. Well-documented mirror sessions help security teams quickly identify the purpose of network monitoring activities ensure that traffic mirroring is being used appropriately within the environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-traffic-mirror-target-description | SA-5 | Requiring descriptions for EC2 traffic mirror targets enhances operational visibility security management by providing context about the purpose configuration of network monitoring infrastructure. Proper documentation through descriptions enables administrators to quickly identify the role of each traffic mirror target, facilitates troubleshooting, supports compliance auditing, reduces the risk of misconfiguration or unauthorized network monitoring activities. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-auto-vpc-attach-disabled | AC-4, SC-7, SC-7(13), SC-7(21), SC-7(4) | Transit Gateways should not automatically accept shared attachments. Cross-account attachment requests should be manually reviewed to ensure that the source is trusted. One way to enforce this is to disable the 'auto accept shared attachments' feature in Transit Gateways so that other accounts cannot connect to the Transit Gateway without manual review and explicit authorization. | Available in all commercial Regions except Asia Pacific (Melbourne) and Asia Pacific (Osaka). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | AU-12, AU-2, AU-3, AU-3(1) | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of VPN connections enables effective resource management, cost allocation, governance oversight. Tags facilitate automated operations, security policies, compliance reporting by providing metadata that identifies resource ownership, purpose, environment, other critical attributes. Consistent tagging practices improve operational visibility support organizational policies for resource lifecycle management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | SI-2(2), SI-2(5) | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabilities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | CM-6, CM-6(1) | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | SC-7, SC-7(3), SC-7(5) | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | CP-9 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-filesystem-ct-encrypted | SC-28, SC-28(1) | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryption, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| efs-in-backup-plan | CP-9 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | AC-3, AC-3(11), AC-4, SC-7, SC-7(28), SC-7(5) | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-resources-in-logically-air-gapped-vault | SC-7, SC-7(21) | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-resources-protected-by-backup-plan | CP-9 | Creating a backup plan for Amazon EFS in AWS Backup ensures that information stored in the file system can be retrieved in the event of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| eip-attached | AC-4, SC-7 | A disassociated Elastic IP (EIP) remains allocated to your account until you explicitly release it. A small hourly charge is incurred for Elastic IP addresses that are not associated with a running EC2 instance. If you no longer need an Elastic IP address, it is recommended that you release it. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operational visibility. Tags enable organizations to categorize track add-ons by environment, owner, project, or cost center, facilitating accurate billing resource governance. Consistent tagging practices support automated management workflows, security policies, compliance reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernetes infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | AU-12, AU-2, AU-3, AU-3(1) | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | SC-12, SC-13, SC-28, SC-28(1) | When you encrypt secrets, you can use AWS Key Managemen t Service (AWS KMS) keys to provide envelope encryptio n of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryptio n for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applicati ons by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | CP-9 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-auto-minor-version-upgrade-check | MA-2(2) | Enabling automatic minor version upgrades for Amazon ElastiCache ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Melbourne), Canada West (Calgary), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-rbac-auth-enabled | AC-2(7), AC-3(7) | RBAC authentication provides fine-grained access control for Redis clusters. Without RBAC, managing access to cache resources could be less secure and more difficult to maintain. Implementing RBAC ensures proper authentication and authorization for cache access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-redis-cluster-automatic-backup-check | CP-9 | Enabling backups ensures that data is protected against accidental deletion, data corruption, and in the case of a system failure, you can restore your cluster from a backup, minimizin g downtime and ensuring business continuity. Point-in-time backups can restore your cluster to a specific point in time. Backups can be used for testing and development purposes, where a copy of the productio n cluster can be replicated for testing new features, debugging, or other development activitie s without impacting the live environment. | Available in all commercial Regions except Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-at-rest | SC-28(1) | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-in-transit | SC-8(1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic, and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-subnet-group-check | AC-4, SC-7(13), SC-7(21) | When launching an Amazon ElastiCac he cluster, a default subnet group is created if one doesn't exist already. The default group uses subnets from the default Virtual Private Cloud (VPC). Using custom subnet groups is more restrictive of the subnets that the cluster resides in, and the networking that the cluster inherits from the subnets. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-description | SA-5 | Application descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand application purposes, enables effective resource governance, assists in troubleshooting and maintenance activities, and ensures accountability in multi-team environments. Well-documented applications also support audit processes and help maintain organizational knowledge as team members change over time. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-application-version-description | SA-5 | Application version descriptions provide essential documentation for tracking changes, understanding deployment history, and maintaining operational visibility. Proper documentation enables teams to quickly identify the purpose and contents of specific application versions, facilitates troubleshooting and rollback procedures, and supports compliance requirements for change management. Without descriptions, organizations lose critical context about application deployments, making it difficult to manage the application lifecycle effectively and increasing the risk of deploying incorrect or outdated versions. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticbeanstalk-environment-description | SA-5 | Environment descriptions provide essential documentation that improves operational visibility, facilitates resource management, and supports compliance requirements. Proper documentation helps teams understand the purpose and context of each environment, reduces troubleshooting time, and ensures accountability in multi-team environments. This practice is particularly important for maintaining clear separation between development, staging, and production environments while supporting audit trails and change management processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-node-to-node-encryption-check | SC-8(1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | CA-7, SI-4 | Enhanced health reporting in Elastic Beanstalk provides deeper visibility into application health status beyond basic instance health checks. This capability monitors additional metrics including CPU utilization, application latency, and request rates, enabling more effective troubleshooting and faster incident response. Without enhanced health reporting, organizations may experience delayed detection of performance degradation, potentially resulting in extended service disruptions and negative impact on application availability. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-managed-updates-enabled | MA-2(2) | Automatically applying managed patches in Elastic Beanstalk ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| elbv2-listener-encryption-in-transit | SC-13, SC-8, SC-8(1) | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-multiple-az | CP-7 | By distributing traffic to registere d instances in multiple availabil ity zones (AZs) the ELB provides high availability, automatic scaling, and robust security that improves fault-tolerance for cloud resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| elb-acm-certificate-required | SC-8(1) | Encrypt data in transit to maintain the confidentiality and integrity of data as it traverses public and unsecured networks and reduce the risk of unauthori zed access to data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-cross-zone-load-balancing-enabled | CP-7 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | SC-7, SC-7(3) | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | SC-8(1) | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-master-no-public-ip | SC-7 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | SC-12, SC-13, SC-28, SC-28(1) | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | SC-13, SC-8, SC-8(1) | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data processing workloads. | |
| encrypted-volumes | SC-13, SC-28, SC-28(1) | Encrypting data at rest on EBS volumes facilitates protectio n of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-launch-description | SA-5 | Requiring descriptions for Evidently launches enhances operational visibility and governance by ensuring proper documentation of feature experiments and rollouts. Descriptive metadata helps teams understand the purpose and context of launches, facilitates troubleshooting and audit processes, and supports effective collaboration across development and operations teams. This practice is essential for maintaining organized experimentation workflows and meeting documentation requirements for compliance frameworks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-launch-tagged | CM-8(2) | Tagging Evidently launches is crucial for maintaining operational visibility and resource management. Proper tagging enables effective resource tracking, cost allocation, and access control. Without structured tagging, organizations may struggle to manage and monitor their feature launches effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-description | SA-5 | Requiring descriptions for CloudWatch Evidently projects enhances operational visibility and governance by ensuring proper documentation of project purposes and objectives. Well-documented projects facilitate team collaboration, simplify project management, enable better resource tracking, and support compliance requirements for maintaining clear audit trails of experimentation activities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-tagged | AC-16(8), CM-8(2) | Proper tagging of Evidently projects is essential for maintaining project organization and visibility. Tags enable effective resource management, cost tracking, and access control. Without structured tagging, organizations risk losing oversight of their experimentation projects. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-description | SA-5 | Requiring descriptions for CloudWatch Evidently segments enhances operational visibility governance by ensuring proper documentation of audience segmentation logic. Well-documented segments improve team collaboration, facilitate troubleshooting of feature flag behaviors, support compliance requirements for change management audit trails. Clear segment descriptions help prevent misconfigurations enable more effective monitoring of experimental features across different user populations. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-segment-tagged | CM-8 | Tagging Evidently segments is crucial for maintaining clear visibility and control over user segmentation. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may face challenges in managing and analyzing their user segments effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | AU-12, AU-2 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-entity-type-tagged | CM-8 | Proper tagging of Fraud Detector entity types is essential for maintaining operational visibilit y and control. Tags facilitate effective resource managemen t, cost tracking, and access control implementation. Without structured tagging, organizat ions risk losing oversight of their fraud detection infrastructure and associated resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-label-tagged | CM-8 | Tagging Fraud Detector labels is crucial for maintaining clear visibility and control over fraud detection configurations. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and analyze their fraud detection labels. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-outcome-tagged | CM-8 | Tagging Fraud Detector outcomes is essential for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their fraud detection outcomes and associated analysis capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| frauddetector-variable-tagged | CM-8 | Proper tagging of Fraud Detector variables is crucial for maintaining clear visibility and control over fraud detection configurations. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may face challenges in managing and analyzing their fraud detection variables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | CM-8, CM-8(2), PM-5 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-resources-protected-by-backup-plan | CP-9, CP-9(5) | Failure to backup Amazon FSx file systems can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | AU-12, AU-2, AU-3, AU-3(1) | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | AU-12, AU-2, AU-3, AU-3(1) | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | SC-13, SC-28, SC-28(1) | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | SI-4 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | CA-7, SI-4, SI-4(2) | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | visibility in containerized environments meeting compliance requirements for runtime threat detection. | |
| guardduty-eks-protection-audit-enabled | AU-6, CA-2(2), CA-7, SI-4, SI-4(16), SI-4(2) | EKS Audit Log Monitoring is crucial for maintaining security visibility in Kubernetes environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilities for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | CA-7, SI-4, SI-4(2) | Runtime monitoring is essential for detecting and responding to security threats in containerized environments. Without runtime monitoring, organizations may be unable to detect container-level security incidents in real-time. Implementing automated runtime monitoring enhances container security posture. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | AU-6(1), AU-7(1), IR-4, IR-4(1), IR-4(13), SC-7(9), SI-4, SI-4(2), SI-4(5) | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| guardduty-lambda-protection-enabled | CA-7, SI-4, SI-4(2), SI-5 | Lambda Protection is crucial for maintaining security visibility in serverless architectures. Without this feature, organizations may miss potential security threats targeting their Lambda functions. Enabling Lambda Protection provides enhanced security monitoring for serverless workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| guardduty-malware-protection-enabled | CA-7, SI-3, SI-4, SI-4(2) | Malware Protection is essential for maintaining a strong security posture against malicious software. Without this feature, organizations may be vulnerable to undetected malware threats. Implementing Malware Protection enhances threat detection capabilities across AWS resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| guardduty-non-archived-findings | AU-6(5), AU-7(1) | Resolving GuardDuty findings is essential to maintaining a secure and resilient cloud environment. By addressing these findings, you proactively mitigate potential security risks and vulnerabilities, safeguarding sensitive data and infrastructure from unauthorized access and malicious activities. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | CA-7, SI-4, SI-4(16), SI-4(2) | RDS Protection is crucial for maintaining database security and detecting potential threats. Without this feature, organizations may miss security incidents targeting their database instances. Enabling RDS Protection provides enhanced security monitoring for database environments. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | CA-7, SI-4, SI-4(2) | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | CA-7, SI-4, SI-4(2) | S3 Protection is essential for maintaining security visibility over storage resources. Without this feature, organizations may miss potential security threats targeting their S3 buckets. Enabling S3 Protection enhances threat detection capabilities for storage environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-group-has-users-check | AC-3, AC-6 | AWS IAM user groups that do not contain any users adds unnecessary operational complexity, increases oversight and could lead to unintentional risk. Ensuring that all user groups have user accounts simplifies management and oversight and reduces risk. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | CM-8, CM-8(2), PM-5 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | AC-2, IA-2, IA-5, IA-5(1) | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | AC-16(10), AC-16(2), AC-3, AC-6, AC-6(10), AC-6(5), AU-12(3), AU-9(4), CM-11(2), CM-5, CM-5(5) | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | AC-16(4), AC-3, AC-3(7), CM-5 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-expiration-check | SC-12, SC-17 | Certificate expiration monitoring is essential for maintaining secure communications. Expired certificates can lead to service disruptions and security vulnerabilities. Regular monitoring helps prevent certificate-related outages and security issues. | Available only in US East (N. Virginia). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | CM-8, CM-8(2) | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-no-policies-check | AC-16(10), AC-16(2), AC-3, AU-12(3), AU-9(4), CM-11(2), CM-5, CM-5(5) | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | AC-2(3) | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| restricted-ssh | AC-17(1), AC-17(3), AC-4, CM-7, SC-7 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | RA-5 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | CA-2(2), RA-5 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | CA-2(2), RA-5 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | RA-5, SA-11(1) | Standard Lambda scanning is essential for maintaining security in serverless architectures. Without regular scanning, organizations may miss potential vulnerabilities in their Lambda runtime environments. Implementing standard scanning helps ensure comprehensive Lambda function security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| internet-gateway-authorized-vpc-only | AC-4, SC-7, SC-7(28), SC-7(4) | This control provides a mechanism that forces attention on which VPC(s) should be allowed to access the public internet. This control will require the appropriate VPC(s) to be identified and labeled as approved for internet accesses through use of an IGW. Failure to identify and validate the list of authorized VPC's could cause unintended access to AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | CM-8 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | CM-8 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-gateway-tagged | AC-16(8), CM-8 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | CM-8 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | CM-8 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industria l IoT initiatives. Without proper tagging, organizat ions may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | IA-5, SC-13 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | CM-8, CM-8(2), PM-5 | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | AC-3, SI-4 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | SC-13, SC-28, SC-28(1) | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | SI-12 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | AC-3, IA-7, SC-12 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | CM-8, CM-8(2), PM-5 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | CA-7, SI-4, SI-4(2) | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | CM-8, CM-8(2), PM-5 | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-certificate-tagged | CM-8, CM-8(2), PM-5 | Tagging Lightsail certificates enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking certificate ownership, purpose, and lifecycle management. Consistent tagging practices improve operational visibility, facilitate automated management tasks, and support compliance requirements by ensuring all SSL/TLS certificates can be properly identified and categorized within the infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | IA-2(1), IA-2(2), IA-2(6) | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | IA-2, IA-5 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-single-instance-broker-storage-type-efs | CP-6, CP-6(1), CP-6(3) | Using EFS storage type for Amazon MQ ActiveMQ single-instance brokers provides enhanced durability, availability, and performance characteristics compared to other storage options. EFS offers automatic scaling, built-in redundancy across multiple Availability Zones, and better integration with AWS backup and recovery services. This storage configuration helps ensure message persistence, reduces the risk of data loss during broker failures, and supports better disaster recovery capabilities for messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-automatic-minor-version-upgrade-enabled | SI-2, SI-2(4) | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | msk-cluster-public-access-disabled | AC-4(21), SC-7, SC-7(21), SC-7(28), SC-7(3), SC-7(5) | By default, clients can access an Amazon MSK cluster only if theyre in the same VPC as the cluster. All communication between Kafka clients and an MSK cluster are private by default and streaming data doesnt traverse the internet. However, if an MSK cluster is configured to allow public access, anyone on the internet can establish a connectio n to Apache Kafka brokers that are running within the cluster. This can lead to issues such as unauthorized access, data breaches, or exploitation of vulnerabilities. If you restrict access to a cluster by requiring authentication and authorization measures, you can help protect sensitive information and | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central) . Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | maintain the integrity of your resources. | |
| msk-cluster-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of MSK clusters is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitating automated governance policies and billing analysis. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain compliance with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | AU-12, AU-2, AU-3 | Enabling logging for an Amazon MSK connector captures operational and error events needed to detect anomalous behavior, troubleshoot failures, and support security investigations. Without connector logs, malicious or erroneous activity can go unnoticed and forensic analysis is limited. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-enhanced-monitoring-enabled | CA-7, SI-4 | Enhanced monitoring is crucial for maintaining operational visibility and performance of Kafka clusters. Without detailed monitoring, organizations may miss critical performance issues or capacity problems. Implementing enhanced monitoring supports better cluster management and troubleshooting. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| msk-in-cluster-node-require-tls | SC-8(1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting data in transit also reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | AC-3, AC-6, IA-2, IA-8 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | AU-12, AU-2, AU-3 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nacl-no-unrestricted-ssh-rdp | AC-17(1), AC-17(3), AC-4, SC-7(28) | Network access control list (NACL) should not allow unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| neptune-cluster-backup-retention-check | CP-10(2), CP-9 | Backups help to recover more quickly from a security incident and strengthen the resilience of the systems. Automating backups for Amazon Neptune DB clusters, enables to restore systems to a point in time, and minimize downtime and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-copy-tags-to-snapshot-enabled | PM-5(1) | Identification and inventory of the IT assets is a crucial aspect of governance and security. In order to have visibility of all the Neptune DB clusters to assess their security posture and take action on potential areas of weakness, Snapshots should be tagged in the same way as their parent DB clusters. Enabling this setting ensures that snapshots inherit the tags of their parent database clusters. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-encrypted | SC-28, SC-28(1) | Enabling storage encryption for Neptune DB clusters protects sensitive data at rest from unauthorized access. This security measure helps prevent data breaches if storage media is compromised or improperly disposed of. Encrypted Neptune instances fulfill compliance requirements for data-at-rest encryption across various regulatory frameworks and industry standards, reducing organizational risk and strengthening your overall cloud security posture. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-multi-az-enabled | CP-2(2), CP-6, CP-7, SC-36, SC-5(2), SC-6, SI-13(5) | Multi-AZ configuration is essential for maintaining database availability and data resilience. Without Multi-AZ, Neptune clusters are vulnerable to single points of failure. Implementing Multi-AZ replication enhances database reliability and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-encrypted | SC-28(1) | Enabling encryption at rest for Amazon Neptune DB cluster snapshots protects the data against unauthorized access to sensitive data, and helps achieve compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-multi-az-enabled | AC-4, SC-7, SC-7(21), SC-7(25), SC-7(26), SC-7(4), SC-7(9), SI-4(3) | By deploying a AWS Network Firewall firewall across multiple AZs, traffic can be balanced and shifted among AZs, which helps in designing highly available solutions. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-rule-group-associated | AC-4, SC-7, SC-7(13), SC-7(21), SC-7(4), SC-7(9) | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | AC-4, SC-7, SC-7(17), SC-7(21), SC-7(4) | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | AC-6(10), CM-3, CM-5, CM-6, CM-6(2), SC-7 | Enabling subnet change protection on Network Firewall instances prevents unauthorized modifications to firewall subnet associations, which could compromise network security boundaries and traffic inspection capabilities. This protection helps maintain the integrity of network segmentation policies and ensures that firewall rules continue to be applied to the intended network traffic flows. Without this protection, malicious actors or accidental configuration changes could bypass security controls by modifying subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-cross-zone-load-balancing-enabled | CP-7 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | SC-7, SC-7(3), SC-7(5) | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | AU-12, AU-2, AU-3 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | CM-8, CM-8(2), PM-5 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | SC-7, SC-7(21), SC-7(28), SC-7(4) | Restricting access to the IGW enhances the security of EC2 instances by protecting sensitive data and reduces the potential for data breaches or unauthorized activities. Restricting access to the IGW aligns with the principle of least privilege and allows for implementation of network segmentation and isolation strategies by controlling outbound connections creating communication boundaries between different parts of network infrastructure reducing the occurrence of lateral movement of threats, limits the impact of potential security incidents, and enhances overall network security and resilience. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | CP-7 | Configuring OpenSearch domains with at least three data nodes and multi-AZ enabled enhances availability, fault tolerance, scalability, performance, data resilience, and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-https-required | SC-8(1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-node-to-node-encryption-check | SC-8(1) | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | CP-10, CP-2(2), CP-6, CP-7, SC-36, SC-5(2), SC-6, SI-13(5) | Primary node fault tolerance is crucial for maintaining OpenSearch cluster reliability. Without sufficient primary nodes, clusters are at risk of service disruptions during node failures. Implementing a three-node primary configuration provides robust fault tolerance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3(1) | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-automatic-minor-version-upgrade-enabled | MA-2(2) | AWS RDS will occasionally deprecate minor engine versions and provide new ones for an upgrade. When the last version number within the release is replaced, the version changed is considered minor. With Auto Minor Version Upgrade feature enabled, the version upgrades will occur automatically during the specified maintenance window so your RDS instances can get the new features, bug fixes, and security patches for their database engines. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-auto-minor-version-upgrade-enable | MA-2(2) | Keeping Amazon Relational Database Service (RDS) clusters up-to-date with the latest minor database engine version ensures timely application of security patches and bug fixes released by AWS. This reduces the possible risk of known vulnerabilities being exploited and maintains a secure and stable database environment. | Available in all commercial Regions except US West (N. California), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | SC-28(1) | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-db-security-group-not-allowed | AC-4, SC-7, SC-7(5) | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. This includes blocking traffic to and from 0.0.0.0/0. | Available only in US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-public-access-check | AC-3(11) | Blocking public access to RDS instances helps keep data safe from unauthorized access, reduces the risk of malicious activitie s, and prevents unnecessary threats. In addition, and if publicly exposed, any brute force attempts logins will lower the database performan ce. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-subnet-igw-check | SC-7, SC-7(28), SC-7(5) | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-in-backup-plan | CP-10(2), CP-9 | Failure to backup RDS instances can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuri ng backups to meet the organization's backup requireme nts is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-last-backup-recovery-point-created | CP-10(2) | Automated backups allow point-in-time recovery for Amazon Relational Database Service (RDS) databases. Enabling this ensures recovery capabilities in the event of data loss or corruption. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | SC-13, SC-8, SC-8(1) | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-multi-az-support | SI-13(5) | Configure multi-AZ deployment for RDS to provide high availability, maintain a synchronous standby replica in a different AZ, and automated failover support in case of disruption of services or regular RDS maintenance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-mysql-instance-encrypted-in-transit | SC-13, SC-8, SC-8(1) | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | CM-8, CM-8(2), PM-5 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3(1) | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | SC-13, SC-8, SC-8(1) | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | SC-13, SC-8, SC-8(1) | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-resources-protected-by-backup-plan | CP-10(2), CP-9 | Failure to backup Amazon Aurora clusters can result in loss of critical data in the event of a disaster, failure, or security incident. Enabling and properly configuring AWS Backup to meet the organization's backup requirements is crucial for the timely and effective restoration of data. An automated backup plan helps maintain data integrity, availability, and recoverability, essential for business continuity and risk mitigation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | SC-13, SC-8, SC-8(1) | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | AU-12, AU-2, AU-3, AU-3(1), AU-6(4) | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | SC-28, SC-28(1) | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-backup-enabled | CP-10(2), CP-9 | Snapshots can be used for data recovery or copied to other regions for the creation of new clusters with existing data. Snapshots play an important role in a disaster recovery and data retention requirements, allowing for the survival of an altered or terminated cluster, or for recovery due to security incidents. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-configuration-check | SC-28(1) | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-kms-enabled | SC-28(1) | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | CP-2, CP-2(2), CP-6, CP-7, CP-7(1), SC-6 | Enabling Multi-AZ deployment for an Amazon Redshift cluster maintains a standby in a second Availability Zone and fails over automatically if an AZ becomes impaired. This improves the availability and resilience of the data warehouse and reduces the risk of data unavailability during infrastructure failures. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-subnet-group-multi-az | CP-6, CP-7, CP-7(1), SC-36 | Configuring a Redshift cluster subnet group with subnets in more than one Availability Zone allows the cluster to be provisioned or recovered across AZs. This improves availability and resilience and reduces the risk that a single AZ disruption makes the data warehouse unavailable. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-require-tls-ssl | SC-8(1) | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | CM-2, CM-6 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | AU-12, AU-2, AU-3 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | CM-3(6), SC-13, SC-8, SC-8(1) | An Amazon Redshift Serverless workgroup is a collection of compute resources that groups together compute resources like RPUs, VPC subnet groups, and security groups. Properties of a workgroup include network and security settings. These settings specify whether connections to a workgroup should be required to use SSL to encrypt data in transit. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | SC-7, SC-7(3), SC-7(5) | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | AC-4, SC-7, SC-7(21) | Routing Redshift Serverless workgroup traffic through a VPC provides essential network isolation and security controls. VPC routing enables organizations to implement network-level access controls, monitor traffic patterns, and maintain compliance with security frameworks that require private network configurations. This control helps prevent unauthorized external access to data warehouse resources and ensures that sensitive data processing occurs within a controlled network environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-unrestricted-port-access | AC-4, SC-7, SC-7(21), SC-7(3), SC-7(5) | Permitting unrestricted inbound access to the Redshift cluster port (IP address with a /0 suffix) can result in unauthorized access or security incidents. We recommend applying the principal of least privilege access when creating security groups and configuring inbound rules. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| required-tags | AC-16, AC-16(8), CP-2(8), PM-5(1) | Tags can help you manage, identify, organize, search for, and filter resources. Tagging can also be used to create new resource constructs for visibility or control (such as grouping together resources that make up a micro-service, application, or workload). Tagging is fundamental to providing enterprise-level visibility and control. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | AC-4, SC-7, SC-7(13), SC-7(21), SC-7(28), SC-7(4), SC-7(5) | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. Not restricting access to ports to only authorized users, can lead to attacks against the availabil ity, integrity and confidentiality of systems. Security Group configurations should not allow ingress traffic from 0.0.0.0, but instead should specify trusted sources per port. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | IA-5 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentials making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | IA-2(1), IA-2(6) | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-in-vpc-only | AC-4, SC-7 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-access-point-public-access-blocks | AC-3(11) | Enabling block public access for Amazon S3 access points enhances security by preventing unauthorized access from the public internet, mitigating the risk of data breaches, and ensuring compliance with security best practices and regulatory requirements. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks | AC-4, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks-periodic | AC-4, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-acl-prohibited | AU-9 | Simplify access management of S3 data by replacing bucket access control lists with IAM (and other) policies to regulate permissions to S3 buckets. Unless there is a need to control access to each object individually, disable ACLs and use policies to control ownership and access. Object ownership means the bucket owner owns all the objects in the bucket, even when uploaded by different AWS accounts, and allows for easy access management. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-cross-region-replication-enabled | SC-6, SI-13(5) | Cross-Region Replication is essential for maintaining data availability and disaster recovery capabilities. Without replication, organizations risk data loss in case of region-wide outages. Implementing Cross-Region Replication enhances data durability and supports business continuity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-default-lock-enabled | AU-9 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | AC-4, AU-9, SC-7 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-logging-enabled | AU-12, AU-2, AU-3 | Server access logging provides a mechanism to detect potential cybersecurity events, unauthorized access and suspicious activity. Each access log record provides details about a single access request and contains the requester, bucket name, request time, request action, response status, and an error code, if relevant. Server access logs are sent from a source bucket to a chosen target S3 bucket in the same AWS Region to ensure redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-policy-grantee-check | AC-3(11) | S3 bucket policies help achieve more specific access permissions and authorizations to keep data protected from unauthorized users. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-public-read-prohibited | AC-3, AC-3(11), AC-3(4), AC-4, AC-6, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | AC-3, AC-3(11), AC-3(4), AC-4, AC-6, AU-9, SC-7 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-replication-enabled | CP-6, CP-6(1), SI-13(5) | Enabling S3 cross-region replication is crucial for ensuring data availability, durability, and compliance. It helps protect against data loss, regional outages, and provides a mechanism for disaster recovery. By replicating data to a different region, organizations can maintain business continuity and meet regulatory requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | AU-9, AU-9(3), SC-28(1) | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-ssl-requests-only | SC-8(1) | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-tagged | CM-8, CM-8(2), PM-5 | Tagging S3 buckets is essential for effective resource management, cost allocation, and governance. Tags enable organizations to categorize buckets by purpose, owner, environment, or project, facilitating accurate cost tracking and billing. Proper tagging also supports automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-versioning-enabled | AU-9 | Object versioning in S3 buckets allows users to keep, restore and recover objects from unintended user actions and applicati on failures. When combined with MFA delete, additional protection is provided to delete objects in S3 permanent ly, or disable object versioning. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-default-encrypt ion-kms | AU-9, AU-9(3), SC-28(1) | Protecting objects in S3 using encryptio n at rest with KMS prevents unauthori zed access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-last-backup-recovery-point-created | CP-9 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | AU-11, AU-4, SI-14(2) | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-in-logically-air-gapped-vault | SC-7(20) | Logical air-gapping is essential for protecting critical S3 data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical S3 bucket data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-protected-by-backup-plan | CP-9 | Performing data backups is critical to a disaster recovery plan. Data is vulnerable to hardware or software malfunctions or data corruption, cyberattacks, accidental deletion, calamities, and more. Ensuring that data is backed up will mitigate the forementioned risks. IMPORTANT NOTE: You must enable S3 Versioning on your S3 bucket to use AWS Backup for Amazon S3. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | AU-11, AU-4, SI-14(2) | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | SC-7, SC-7(3), SC-7(5) | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-config-prod-instance-count | CP-7, CP-7(1), SC-6 | Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architect ure. High availabil ity helps you to recover from security incidents. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | CM-8, CM-8(2), PM-5 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-image-description | SA-5 | Requiring descriptions for SageMaker images enhances operational visibility and governance by providing essential metadata about image contents, purpose, and usage. Proper documentation through descriptions facilitates image management, enables teams to understand image functionality, supports compliance auditing, and reduces the risk of using inappropriate or outdated images in machine learning workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | SC-7, SC-7(3) | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | SC-28, SC-7, SC-7(3) | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | AU-6(1), AU-6(3), AU-6(4), AU-6(5), CA-7, CA-7(4), CA-7(6), IR-4(1), IR-4(14), SI-4(11), SI-4(16) | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | AC-3 | Portfolio sharing only within Organizations helps ensure that a portfolio isnt shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub recommends using ORGANIZATIONMEMBER ACCOUNT instead of ACCOUNT. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ses-malware-scanning-enabled | SI-8 | Malware scanning in SES is crucial for protecting email workflows from potential security threats. Without scanning, malicious attachments or spam could infiltrate your systems. Implementing malware scanning helps maintain email security and prevents potential infections. | Available only in US East (N. Virginia), US West (Oregon), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-message-delivery-notification-enabled | IR-6(1) | Logging message delivery status helps provide better operational insight, such as, knowing whether a message was delivered to the Amazon SNS endpoint, identifying the response sent from the Amazon SNS endpoint to Amazon SNS, determining the message dwell time (the time between the publish timestamp and just before handing off to an Amazon SNS endpoint). | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | AC-3, AC-4 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthorized data access or potential information leaks. Implementing private access controls helps protect sensitive communication channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-dlq-check | IR-4(3), SI-10, SI-10(3) | Dead letter queues are essential for robust message processing architectures as they provide a mechanism to isolate and examine messages that repeatedly fail processing. Without DLQ configuration, failed messages may be lost permanently or continue consuming processing resources through infinite retry loops. This control helps ensure message durability, enables debugging of processing failures, prevents resource exhaustion from problematic messages, and supports compliance requirements for data retention and audit trails in distributed systems. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | transfer-connector-logging-enabled | AU-12, AU-2, AU-3, AU-6(4) | Enabling CloudWatch logging for AWS Transfer Family Connectors is essential for maintaining operational visibility, security monitoring, compliance requirements. Comprehensive logging enables organizations to track file transfer activities, monitor connector performance, detect anomalous behavior, maintain audit trails for regulatory compliance. Without proper logging, organizations lose critical visibility into data transfer operations, making it difficult to troubleshoot issues, investigate security incidents, or demonstrate compliance with data governance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | SC-13, SC-8, SC-8(1) | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-last-backup-recovery-point-created | CP-6(2), CP-9 | Regular recovery point creation is crucial for maintaining virtual machine data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of VM failures. Implementing regular backups provides a reliable mechanism for virtual machine protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-in-logically-air-gapped-vault | CP-6(2), CP-9 | Regular recovery point creation is crucial for maintaining volume data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of volume failures. Implementing regular backups provides a reliable mechanism for volume protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-protected-by-backup-plan | CP-9 | Ensuring EC2 instances are included in a backup plan allows for recovery of instance data and applications in the event of loss or corruption. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-default-security-group-closed | AC-4, SC-7, SC-7(13), SC-7(21), SC-7(4), SC-7(5) | Default VPCs and any VPCs that are created come with a default security group. With some resources , default security group is automatic ally assigned if the resource is created without specifying a custom security group. Default security group outbound/inbound rule allows all traffic and this can increase opportunities for malicious activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | SC-7(9), SI-4(11), SI-4(25) | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. These logs can be used to respond quickly to anomalous traffic and can aid in incident response investigations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | AC-4 | Having unused network Access Control Lists (ACLs) increases the risk of unauthorized access to VPC EC2 resources and should be removed once not needed any longer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-peering-dns-resolution-check | AC-4, SC-7, SC-7(21), SC-7(4) | VPC peering reduces network latency by using only internal addresses. It enhances network security by not exposing services to the public internet and reduces potential DNS based attacks which can compromise the confidentiality, integrity and availability of resources in the VPCs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-open-only-to-authorized-ports | AC-4, SC-7, SC-7(13), SC-7(21), SC-7(4) | High risk ports are often exposed to the Internet and easily exploitable by attackers. Security groups provide stateful filtering of ingress and egress network traffic to AWS. Security group rules should follow the principal of least privileged access. Unrestricted access (IP address with a /0 suffix) increases the opportunity for malicious activity such as hacking, denial-of-service attacks, and loss of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | SC-7, SC-7(19), SC-7(3), SC-7(5) | Controlling inbound access to sensitive ports is crucial for maintaining network security. Unrestricted access to ports like SSH (22) or RDP (3389) could lead to unauthorized system access and potential breaches. Implementing strict port access controls helps prevent unauthorized access to resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-not-empty | AC-4, SC-7(17) | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-webacl-not-empty | SC-7(17) | Web access control lists (ACLs) without any configured rules or rule groups will not perform traffic inspection or filtering, allowing all web traffic to pass through unchecked. Configuring rules or rule groups enables enforcement of web application security policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| waf-global-rulegroup-not-empty | SC-7(17) | AWS Web Application Firewall (WAF) Classic global rule groups, without any configured rules, will not inspect or filter web traffic, potentially allowing malicious or unauthorized traffic to pass through. Configuring rules enables traffic inspection and enforcement of security policies. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-rule-not-empty | SC-7(17) | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-webacl-not-empty | SC-7(17) | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-regional-rulegroup-not-empty | SC-7(17) | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-regional-rule-not-empty | SC-7(17) | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-regional-webacl-not-empty | SC-7(17) | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-root-volume-encryption-enabled | SC-13, SC-28, SC-28(1) | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | SC-13, SC-28, SC-28(1) | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | CM-8, CM-8(2), PM-5 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

## Payment Card Industry Data Security Standard (PCI DSS) v4

This AWS Config managed conformance pack provides a curated mapping between the Payment Card Industry Data Security Standard (PCI DSS) Version 4 requirements and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more PCI DSS requirements. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** PCI-DSS_V4

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 351 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| access-keys-rotated | 8.3.9 | Rotating access keys will reduce the window of opportunity for an access key that is associated with a compromised or terminated account to be used. Access keys should be rotated to ensure that data cannot be accessed with an old key which might have been lost, cracked, or stolen. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | | in the AWS GovCloud (US) Regions. |
| acm-certificate-expiration-check | 4.2.1 | Expired certificates could allow malicious actors to impersonate legitimate entities, potentially leading to data breaches or other security incidents. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| acm-certificate-rsa-check | 4.2.1 | Configuring a key length of at least 2,048 bits, protects the AWS resources and data encrypted today for many years into the future, as computing power becomes less expensive and servers become more advances. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-http-drop-invalid-header-enabled | 1.2.6, 2.2.6, 6.4.2 | Enabling the attribute Drop Invalid Header Fields security feature mitigates the risk of cross-site scripting (XSS) or server-side request forgery (SSRF) by dropping the invalid header fields protection backend instances from potential vulnerabilities. Dropping the invalid header fields ensures only properly formatted requests are forwarded to the backend instances reducing application failures or disruptions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-internal-scheme-check | 1.3.1, 1.4.4 | Internal scheme configuration for Application Load Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. This configura tion helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requireme | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | nts that mandate network segmentat ion and controlled access to application infrastructure. | |
| alb-waf-enabled | 6.4.2 | AWS WAF helps protects your website from common attack techniques like SQL injection, Cross-Site Scripting (XSS), and block or rate-limit traffic from specific user-agents among other protections, to prevent malicious actors from exploitin g application security vulnerabilities. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gwv2-access-logs-enabled | 10.4.2 | API Gateway access logs can provide detailed information about who has accessed your API and how the caller accessed the API. These logs are essential for security, audits and forensics investigations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| api-gw-associated-with-waf | 6.4.2 | Without WAF association, Amazon API Gateway is vulnerable to malicious web attacks such as SQL-Injection and Cross-site Scripting. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-cache-enabled-and-encrypted | 2.2.1 | When caching is enabled, Amazon API Gateway service caches responses from API endpoint, reduces the number of calls made to an API endpoint and improves the latency of requests to the API. In addition, encrypted REST API caches protect data from unauthorized access. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | 10.2.1, 10.2.1.5, 10.4.2 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-ssl-enabled | 4.2.1 | Use SSL certificates with API Gateway to provide an additional layer of security. With this configuration, API Gateway authenticates HTTP requests and allows only those originating from API Gateway to access backend systems, even if the backend is publicly accessible. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | 12.5.1 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | 12.5.1 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | 2.2.1 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | 12.5.1 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | 12.5.1 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | 12.5.1 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | 1.3.1, 1.3.2 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | 12.5.1 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | 12.5.1 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | 4.2.1 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | 10.2.1 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | 12.5.1 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | 4.2.1 | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | 10.2.1 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | 12.5.1 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | 12.5.1 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | 12.5.1 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| approved-amis-by-tag | 2.2.1 | Tags enable you to categorize your AMIs and EC2 resources in different ways, for example, by purpose, owner, or environment and manage resource operations, such as inventory management, patching, scanning, tracking, etc. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | 1.3.2, 1.4.1, 1.4.5 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | 1.4.4 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appstream-fleet-in-vpc | 1.4.4 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configuration supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-associated-with-waf | 6.4.2 | Integrating AppSync with AWS WAF provides protection against common web vulnerabilities like injection, XSS, and unauthorized access, reducing breach risk. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | 3.5.1 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | 4.2.1 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | 3.5.1 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | 10.2.1, 10.2.2 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | 10.2.1, 10.2.1.5, 10.4.2 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | 2.2.1, 3.5.1 | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | 2.2.1 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-engine-version-auto-upgrade | 6.3.3 | Enabling automatic engine version upgrades for Athena workgroups ensures that query processing benefits from the latest performance improvements, security patches, and feature enhancements without manual intervention. This configuration reduces operational overhead by eliminating the need to manually track and apply engine updates, while maintaining access to the most current security fixes and optimizations that AWS provides for the Athena service. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | 10.2.1, 10.2.1.2 | Audit logs track and monitor system activities. They provide a record of events that can help you detect security breaches, investigate incidents, and comply with regulations. Audit logs also enhance the overall accountability and transparency of your organization. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| aurora-mysql-cluster-audit-logging | 10.2.1, 10.2.1.2 | Database logs can assist with security and access audits and help diagnose availability issues. Audit logs capture a record of database activity, including login attempts, data modifications, schema changes, and other events that can be audited for security and compliance purposes. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launchconfig-requires-imdsv2 | 2.2.6 | IMDSv2 is an enhancement to instance metadata access that requires session-oriented requests to add defense in depth against unauthorized metadata access. IMDSv2 requires a PUT request to initiate a session to the instance metadata service and retrieve a token. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| autoscaling-launch-config-hop-limit | 2.2.6 | Using token hop limits for EC2 prevents attackers from gaining unauthorized access to sensitive resources by chaining together multiple EC2 instances as hops. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-public-ip-disabled | 1.4.4, 1.4.5, 2.2.6 | By disabling public IP assignment, the attack surface for EC2 instances launched via ASGs, the attack surface is reduced by prohibiting direct internet access. Instead, place EC2 instances in private VPC subnets and enforce access through the associated load balancer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| autoscaling-launch-template | 2.2.1 | Using a launch template to create an Auto Scaling group ensures access to the latest features and improvements. | Available in all commercial Regions except Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-recovery-point-encrypted | 2.2.1 | Encrypt AWS Backup recovery point to protect the backup information. Encrypting the backup recovery point ensures the confidentiality and integrity of the stored backup information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | 2.2.1 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | vulnerabilities or operational issues. | |
| cloudfront-accesslogs-enabled | 10.4.2 | Without CloudFront logs, detailed records of requests will not be available to review and investigate any anomalies that may have occurred. Ensuring access logging cannot be disabled will provide assurance that the data cannot be tampered should a security incident occur for further investigation and remediation. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-associated-with-waf | 6.4.2 | Configuring AWS WAF web ACL to monitor and block HTTP and HTTPS requests prevent unathorized or malicious attacks on CloudFront distributions minimizing the risk of a security event. It monitors for specific conditions such as IP addresses and query strings to control access to content and prevents malicious attacks on CloudFront distributions. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-custom-ssl-certificate | 4.2.1 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-default-root-object-configured | 2.2.6, 6.2.4 | Without a default root object configured, requests to the root URL of a CloudFront distribution may expose directory listings or other unintended content. Configuring a default root object ensures that users receive a specific file when accessing the distribution's root URL, reducing the risk of information disclosure and maintaining better control over content delivery. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | 2.2.4, 4.2.1 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudfront-origin-lambda-url-oac-enabled | 6.4.1 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-security-policy-check | 4.2.1 | Enforcing the recommended minimum security policy helps secure CloudFront distributions and protects against potential vulnerabilities or security threats. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-traffic-to-origin-encrypted | 4.2.1 | Encrypting traffic between CloudFront distribution and its custom origin will ensure that the environment is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-viewer-policy-https | 4.2.1 | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | 10.2.1, 10.2.2, 10.3.2, 10.3.4 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for read data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | if you configure a multi-Region trail that logs read-only or all types of data events for all S3 buckets. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | if you configure a multi-Region trail that logs write-only or all types of data events for all S3 buckets. | |
| cloudtrail-s3-bucket-access-logging | 10.2.1 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-bucket-public-access-prohibited | 10.3.1 | Protecting CloudTrail logs from public access is essential for maintaining the security of audit data. Public exposure of audit logs could reveal sensitive information about your infrastructure and operations. Implementing strict access controls prevents unauthorized access to critical security information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudtrail-s3-data events-enabled | 10.2.1 | Logging data events on S3 buckets is an important piece of maintaining the reliability, availabil ity, and performan ce of Amazon S3 and your AWS solutions. Collecting monitoring data for object-level requests supports your Incident Response plan by allowing you to identify potential issues and respond on a timely manner; or to provide valuable data for forensics, auditing, and compliance. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cloudtrail-security-trail-enabled | 10.2.1 | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | 11.5.2 | Security groups act as a firewall and controls the inbound and outbound traffic for the resources that it is associated with. They are normally created during the initial stages of the infrastructure setup. Once the infrastructure is finalized, changes to the existing security group setup can indicate a potential malicious activity. Therefore the change action needs to be alerted to the customer and reconciled against the change management system of record. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloudwatch-alarm-action-enabled-check | 10.7.2 | CloudWatch Alarms trigger automated notifications and actions when reaching pre-defined thresholds. Disabling CloudWatch alarms will stop continuous monitoring, and delay responses to events affecting critical applications or functions. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |

| codebuild-project-s3-logs-encrypted | 2.2.1 | Enforcing encryption on S3 logs generated by AWS CodeBuild projects protects the confidentiality and integrity of data. This control analyzies the settings and policies of the CodeBuild project and S3 bucket to ensure that encryption is enforced for logging. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| codebuild-project-source-repo-url-check | 8.3.2, 8.6.2 | This control helps prevent the inadvertent exposure of sensitive credentials or access tokens in the source repository URL. Additionally, it helps maintain the confidentiality and security of the associated repositories, and ensures that only authorized personnel can access them. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-encrypted-at-rest | 3.5.1 | Encrypting CodeBuild report groups is crucial for protecting sensitive build and test information. Unencrypted report data could be exposed if storage systems are compromised. Implementing encryption adds an essential layer of security for build and test results. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | 12.5.1 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | 6.3.3 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | 7.2.1, 7.3.1, 8.2.1, 8.3.1 | Preventing unauthenticated access to Cognito Identity Pools is critical for maintaining security boundaries and implementing proper access controls. Allowing unauthenticated identities can expose AWS resources to unauthorized users, potentially leading to data breaches, resource abuse, or compliance violations. By monitoring and detecting Identity Pools with unauthenticated access enabled, organizations can ensure that all users are properly authenticated before receiving temporary AWS credentials, supporting defense-in-depth security strategies and regulatory compliance requirements. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-advanced-security-enabled | 8.2.1, 8.2.5, 8.3.3 | Advanced security features in Cognito user pools are essential for protectin g against unauthori zed access and potential threats. Without these features, user accounts may be more vulnerable to attacks such as credential stuffing or brute force attempts. Enabling advanced security strengthens overall user authentic ation and access control. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | 12.5.1 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| connect-instance-logging-enabled | 10.2.1 | Enabling flow logs for Amazon Connect instances provides critical visibility into call flows, customer interactions, and system operations. Flow logs capture detailed information about contact routing, agent interactions, and system events, which are essential for troubleshooting issues, monitoring performance, analyzing customer experience, and maintaining audit trails. This logging capability supports compliance requirements, enables proactive monitoring of contact center operations, and provides the data necessary for optimizing call flows and identifying potential security or operational issues. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| custom-eventbus-policy-attached | 7.2.2, 7.2.5 | Attaching a resource policy helps control access to custom EventBus resources , enforcing least privilege and reducing the risk of unauthorized access. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | 4.2.1 | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |
| datasync-task-logging-enabled | 10.2.1, 10.2.1.1, 10.2.1.2, 10.2.1.3, 10.2.1.4, 10.2.1.5, 10.2.1.6, 10.2.1.7 | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-encryption-enabled | 2.2.1 | Encrypting DynamoDB Accelerator Clusters at rest is essential to safeguard sensitive information and maintain data confidentiality. By employing encryption, organizations can thwart unauthorized access to data, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Spain), Europe (Stockholm), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | 4.2.1 | Enabling encryption in transit protects DAX cluster data from unauthorized access during transmission over networks, maintaining data confidentiality. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-auto-minor-version-upgrade-check | 6.3.3 | Enabling automatic minor version upgrades for AWS Database Migration Service (DMS) ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| dms-endpoint-ssl-configured | 4.2.1 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | 12.5.1 | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | accountability across database migration projects. | |
| dms-mongo-db-authentication-enabled | 8.3.1 | Enabling authentication for MongoDB endpoints is critical for maintaining data security during migrations. Without proper authentication, unauthorized access to sensitive data could occur. Implementing password-based authentication helps protect MongoDB data stores from unauthorized access and potential data breaches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-neptune-iam-authorization-enabled | 7.2.1, 7.2.4 | IAM authentication for Neptune endpoints provides robust, scalable access control. Without IAM authentication, managing access to Neptune databases during migrations could be less secure and more complex. Implementing IAM authorization ensures fine-grained control over who can access Neptune data through DMS. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-redis-tls-enabled | 4.2.1 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-not-public | 1.4.4 | Database migration instances often contain sensitive data, by restricting public access, you reduce the risk of data breaches or unauthorized access to this sensitive information. This helps ensure that only trusted entities can interact with the database migration instances, reducing the risk of unauthorized changes or data manipulation. Allowing public access to database migration instances increases the attack surface and exposes them to potential security threats. Restricting access helps prevent unauthorized individuals or malicious actors from attempting to gain access to the database or exploit any vulnerabilities in | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | the form of various attacks; brute force attacks, SQL injection , or unauthorized data exfiltration. By restricting public access, you can enforce network segmentation and isolate the database migration instances from the public internet, adding a defense depth strategy. | |
| dms-replication-task-sourcedb-logging | 10.2.1, 10.4.2, 10.5.1 | Proper logging of DMS replicati on tasks is crucial for maintaining operational visibilit y and ensuring data integrity. Without adequate logging, issues in the replicati on process might go undetected, potentially leading to data inconsist encies. Configuring appropriate logging supports efficient troubleshooting and monitoring of migration processes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-tagged | 12.5.1 | Proper tagging of DMS replication tasks enables effective resource management, cost allocation, and governance. Tags facilitate tracking of migration projects, identifying resource ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into their migration activities and cannot effectively manage costs or apply security policies across their DMS infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-replication-task-targetdb-logging | 10.4.2 | Enabling logging for AWS Database Migration Service (DMS) replication allows for monitoring, troubleshooting, auditing, performance analysis, error detection, and recovery, as well as historical analysis and reporting. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| docdb-cluster-audit-logging-enabled | 10.2.1 | Enabling Amazon Cloudwatch logs allows you to audit events that were performed in Amazon DocumentDB elastic clusters. Examples of logged events include successful and failed authentication attempts, dropping a collection in a database, or creating an index. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted | 2.2.1, 3.5.1 | Encrypting data at rest protects the confidentiality and integrity of data and reduces the risk of unauthorized access to data. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Mexico (Central), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | 4.2.1 | Encryption in transit protects sensitive data as it moves between DocumentDB clients and clusters, preventing unauthorized interception and eavesdropping on database communications. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transmission. Enabling TLS encryption ensures that database credentials, queries, and results remain confidential and maintain integrity during network transmission. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-snapshot-public-prohibited | 1.4.4 | Public snapshots are available to all AWS accounts and may result in unintended data exposure. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), Israel (Tel Aviv), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |
| dynamodb-table-encrypted-kms | 2.2.1 | Encryption of data at rest in DynamoDB is enabled by default. Using AWS KMS reduces the operational complexity of managing encryption keys by integrating transparently with DynamoDB. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-table-encryption-enabled | 2.2.1 | Provide data security and privacy by ensuring encryption is enabled for your DynamoDB tables. | Available in all commercial Regions except Asia Pacific (New Zealand). Available in the AWS GovCloud (US) Regions. |
| ebs-resources-in-logically-air-gapped-vault | 1.3.1, 1.3.2 | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| ebs-snapshot-public-restorable-check | 7.2.5 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | 12.5.1 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-connection-log-enabled | 10.4.2 | Enabling logging captures connection details, facilitating monitoring, auditing, and troubleshooting of Client VPN activities and potential security incidents. | Available in all commercial Regions except Asia Pacific (Hyderabad), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| ec2-client-vpn-not-authorize-all | 7.2.2 | Restricting authorized networks for Amazon VPC Lattice endpoints helps prevent unauthorized access and potential security breaches from untrusted networks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-ebs-encryption-by-default | 2.2.1 | Sensitive data can exist at rest on EBS volumes. All sensitive data should be protected at rest using strong cryptography, to protect the confidentiality and integrity of information and prevent and protect data in storage. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | 1.3.1, 1.3.2, 1.4.2 | Source/destination check is a critical security feature that ensures network interfaces can only send receive traffic that is specifically destined for or originates from the interface. Disabling this check without proper justification can create security vulnerabilities by allowing traffic forwarding potential network bypasses. Monitoring this setting helps maintain network security boundaries, prevents unauthorized traffic routing, ensures compliance with network security policies. This control is particularly important for maintaining the integrity of network traffic flows preventing potential security misconfigurations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-imdsv2-check | 2.2.6 | IMDSv2 is an enhancement to instance metadata access that requires session-oriented requests to add defense in depth against unauthorized metadata access. IMDSv2 requires a PUT request to initiate a session to the instance metadata service and retrieve a token. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-detailed-monitoring-enabled | 10.4.2 | Enabling detailed monitoring on EC2 instances helps better manage the EC2 resources and facilitates finding trends and taking appropriate actions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | 2.2.1 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-instance-no-public-ip | 1.4.2, 1.4.4, 2.2.4 | Restricting the use of Public IP helps reduce the risk of unintentional external network communication with EC2 instances. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-launch-template-imdsv2-check | 2.2.6 | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ec2-launch-template-public-ip-disabled | 1.4.4 | Assigning public IPs via Amazon EC2 launch template makes any Amazon EC2 instances utilizing that template public and can possibly lead to unintended access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-managedinstance-association-compliance-status-check | 2.2.1 | SSM interactive sessions provide centralized and granular access controls to EC2 instances and enhance reliability along with user attribution in sessions. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| ec2-managedinstance-patch-compliance-status-check | 6.3.3 | Regular patching is crucial for addressing vulnerabilities. You can leverage SSM to patch EC2 instances and address security vulnerabilities, maintain compliance and improve performance. | Available in all commercial Regions except Asia Pacific (Osaka) and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-paravirtual-instance-check | 2.2.6 | EC2 instance AMIs should not be paravirtual (PV) as they have a regional based limitation while recovering or launching in a different region. PV also cannot take advantage of special hardware extensions such as enhanced networking or GPU processing. | Available only in US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| ec2-resources-in-logically-air-gapped-vault | 1.3.1, 1.3.2 | Logical air-gapping is essential for protecting critical compute resources from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive systems. Implementing air-gapping provides an additional security barrier for critical EC2 instances. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| ec2-security-group-attached-to-eni | 1.2.7 | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ec2-security-group-attached-to-eni-periodic | 1.2.7 | Unused EC2 security groups adds unnecessary attack surfaces and clutter to an AWS account. Periodic account reviews and hygiene helps provide improved resource management and security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | 3.5.1 | Enabling encryption at rest for EBS volumes attached to EC2 Spot Fleet instances protects sensitive data from unauthorized access helps meet regulatory compliance requirements. Encryption ensures that data stored on EBS volumes is protected both in transit to the storage backend while at rest, reducing the risk of data exposure in case of unauthorized access to the underlying storage infrastructure. This control is particularly important for Spot Fleet instances as they may be terminated recreated frequently, making consistent encryption enforcement critical for maintaining data security across the fleet lifecycle. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-token-hop-limit-check | 2.2.6 | Using token hop limits for EC2 prevents attackers from gaining unauthorized access to sensitive resources by chaining together multiple EC2 instances as hops. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-auto-vpc-attach-disabled | 1.4.2 | Transit Gateways should not automatically accept shared attachments. Cross-account attachment requests should be manually reviewed to ensure that the source is trusted. One way to enforce this is to disable the 'auto accept shared attachments' feature in Transit Gateways so that other accounts cannot connect to the Transit Gateway without manual review and explicit authorization. | Available in all commercial Regions except Asia Pacific (Melbourne) and Asia Pacific (Osaka). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-logging-enabled | 10.2.1, 10.2.2 | AWS Site-to-Site VPN logs provide you with deeper visibility into your Site-to-Site VPN deployments. With this feature, you have access to Site-to-Site VPN connection logs that provide details on IP Security (IPsec) tunnel establish ment, Internet Key Exchange (IKE) negotiations, and dead peer detection (DPD) protocol messages. Site-to-Site VPN logs can be published to CloudWatch Logs. This feature provides customers with a single consistent way to access and analyze detailed logs for all of their Site-to-Site VPN connections. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | 11.3.1 | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabilities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | 2.2.1 | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| ecs-containers-nonprivileged | 7.2.2, 7.2.5 | ECS containers should run as non-privileged to protect data and prevent that elevated privileges on the host container instance (similar to the root user) result in unauthorized or unintended changes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-containers-readonly-access | 7.2.2, 7.2.5 | This control is necessary to reduce security attack vectors, since the container instance's filesystem cannot be tampered with or written to unless it has explicit read-write permissions on its filesystem folder and directories. This control also adheres to the principle of least privilege. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ecs-container-insights-enabled | 10.4.2 | Container Insights enables monitoring of ECS clusters, applications and microservices running on these clusters, by analyzing and querying the log data in CloudWatch logs to identify and resolve potential failures or issues, and validate deployed fixes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-fargate-latest-platform-version | 6.3.3 | Configuring ECS tasks to adopt the latest Fargate platform version ensures these services incorporate the latest security updates and bug fixes, and helps protect your organization against known vulnerabilities and exploits. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ecs-task-definition-log-configuration | 10.4.2 | Collecting data from task definitions provides visibility, which can enable processes debugging and identification of the root cause of errors. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | 1.2.1, 1.3.1, 1.4.1 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentation, reduces the attack surface, ensures containers operate within isolated network environments as intended by containerization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-nonroot-user | 7.2.2, 7.2.5 | Running tasks with elevated privilege s, such as root, increases the attack surface and security vulnerabilities. Ensure access restriction to the underlying host and other resources by assigning non-root users in Amazon ECS task definitions. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-pid-mode-check | 2.2.6 | If the host PID namespace is shared with container s, it would allow containers to see all of the processes on the host system. This reduces the benefit of process level isolation between the host and the containers. These circumstances could lead to unauthorized access to processes on the host itself, including the ability to manipulate and terminate them. Customers shouldn't share the host's process namespace with containers running on it. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| ecs-task-definition-user-for-host-mode-check | 7.2.2, 7.2.5 | By using this configuring in ECS, you can run tasks that use the host network mode and prevent elevated privileges that can result in unintende d or unexpected actions. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-access-point-enforce-root-directory | 2.2.6 | Access point can be used to override the root directory for a file system. When a root directory is enforced, the NFS client using the access point uses the root directory configured on the access point instead of the file system's root directory and prevents unintended access to data and data disclosure. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| efs-access-point-enforce-user-identity | 7.2.2, 7.2.5 | Use access point with user identity to enforce user and group information for all EFS requests. This approach also overrides any identity information provided by the NFS client, reducing the risk of unintended access to data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-encrypted-check | 2.2.1 | Encrypting data at rest on EFS protects data from unauthorized access, reduces the risk of potential data breaches, and meets compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-filesystem-ct-encrypted | 3.5.1 | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryption, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-mount-target-public-accessible | 1.4.4 | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-logging-enabled | 10.2.1 | Collecting Amazon Elastic Kubernetes Service (EKS) control plane logs for EKS clusters records operations for audit and diagnostic purposes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | 10.2.1 | Collecting Amazon Elastic Kubernetes Service (EKS) control plane logs for EKS clusters records operations for audit and diagnostic purposes. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| eks-cluster-secrets-encrypted | 3.6.1, 8.3.2 | Encrypting Amazon Elastic Kubernetes Service (EKS) secrets ensures confidentiality of sensitive cluster data, protecting it from unauthorized access and potential data breaches. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| eks-endpoint-no-public-access | 1.4.4 | Restricting public access reduces risk exposure and unintentional access to EKS endpoints. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-secrets-encrypted | 8.3.2 | Using unencrypted secrets can expose secrets to unauthorized services/individuals which could pose a security risk. By ensuring secrets are encrypted, the risk of unintentional access can be mitigated, and provides defense in depth preventing unauthorized access to the cluster. | Available in all commercial Regions except Asia Pacific (New Zealand). Available in the AWS GovCloud (US) Regions. |
| elasticache-auto-minor-version-upgrade-check | 6.3.3 | Enabling automatic minor version upgrades for Amazon ElastiCache ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Melbourne), Canada West (Calgary), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-rbac-auth-enabled | 7.2.1 | RBAC authentication provides fine-grained access control for Redis clusters. Without RBAC, managing access to cache resources could be less secure and more difficult to maintain. Implementing RBAC ensures proper authentication and authorization for cache access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-at-rest | 2.2.1 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticache-repl-grp-encrypted-in-transit | 4.2.1 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic, and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-encrypted-at-rest | 2.2.1 | Configuring encryption at rest for OpenSearch is crucial to ensure the security and confidentiality of your data. By encrypting data at rest, you protect it from unauthorized access and potential breaches, mitigating the risk of data exposure. This essential security measure helps maintain compliance with industry standards and regulations, building trust with users and safeguarding your organization's reputation. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticsearch-in-vpc-only | 1.4.4, 7.2.2, 7.2.5 | Placing OpenSearch domains in a VPC provides network isolation by separating them from the public internet to protect them from unauthorized access and prevent potential security threats through network access control lists (ACLs), and security groups defense in-depth security. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| elasticsearch-node-to-node-encryption-check | 2.2.1 | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-managed-updates-enabled | 6.3.3 | Automatically applying managed patches in Elastic Beanstalk ensures consistent and timely updates, reducing the risk of security vulnerabilities and downtime. | Available in all commercial Regions except Asia Pacific (Taipei), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| elbv2-acm-certificate-required | 4.2.1 | SSL certificates provided by AWS Certificate Manager (ACM) on Load balancers facilitate the management of certificates, keep data secure and prevent data in transit from Man in the Middle attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | 4.2.1 | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-acm-certificate-required | 4.2.1 | Encrypt data in transit to maintain the confidentiality and integrity of data as it traverses public and unsecured networks and reduce the risk of unauthori zed access to data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | 1.3.1, 1.3.2, 1.4.2 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-logging-enabled | 10.4.2, 6.2.4 | Access logs are disabled by default for your Application Load Balancer (ALB), Classic Load Balancer (CLB) and Network Load Balancer (NLB). By enabling access logs, you can obtain detailed records of HTTP/HTTPS requests made to your Load Balancer which can help analyze traffic patterns, implement protective plans and identify and troubleshoot security issues in a timely manner. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| elb-tls-https-listeners-only | 4.2.1 | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-block-public-access | 1.4.4 | Preventing Amazon Elastic MapReduce (EMR) from launching a cluster in a public subnet protects data from unauthorized access. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |
| emr-master-no-public-ip | 1.4.4, 1.4.5, 2.2.6 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | 3.5.1 | Encryption at rest for Amazon EMR clusters protects sensitive data stored on cluster instances from unauthorized access. This control helps ensure compliance with data protection regulations and security best practices by detecting EMR configurations that lack proper encryption settings. Monitoring encryption configuration helps prevent data exposure risks and maintains data confidentiality for big data processing workloads. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | 4.2.1 | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | data processing workloads. | |
| encrypted-volumes | 2.2.1, 3.5.1 | Encrypting data at rest on EBS volumes facilitates protectio n of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| evidently-launch-t agged | 12.5.1 | Tagging Evidently launches is crucial for maintaining operational visibilit y and resource management. Proper tagging enables effective resource tracking, cost allocation, and access control. Without structured tagging, organizations may struggle to manage and monitor their feature launches effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-tagged | 12.5.1 | Proper tagging of Evidently projects is essential for maintaining project organization and visibility. Tags enable effective resource management, cost tracking, and access control. Without structured tagging, organizations risk losing oversight of their experimentation projects. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | 10.2.1 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | 12.5.1, 12.5.2 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | 10.2.1, 10.2.1.1, 10.2.1.2, 10.2.1.4, 10.2.1.5, 10.2.1.6 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | 10.2.1, 10.2.1.1, 10.2.1.2, 10.2.1.4, 10.2.1.5, 10.2.1.6, 10.2.1.7 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | 3.5.1 | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | 11.5.1 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | 11.5.1, 5.3.2 | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | visibility in containerized environments meeting compliance requirements for runtime threat detection. | |
| guardduty-eks-protection-audit-enabled | 10.2.1, 10.2.2, 10.4.1, 10.4.2 | EKS Audit Log Monitoring is crucial for maintaining security visibility in Kubernetes environments. Without this feature, organizations may miss important security events and potential threats in their EKS clusters. Enabling this GuardDuty feature enhances threat detection capabilities for containerized workloads. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | 11.5.1, A3.5.1 | Runtime monitoring is essential for detecting and responding to security threats in containerized environments. Without runtime monitoring, organizations may be unable to detect container-level security incidents in real-time. Implementing automated runtime monitoring enhances container security posture. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | 11.5.1 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | 10.2.1, 10.4.1, 10.4.1.1, 11.5.1 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Lambda Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Lambda Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | 5.2.2, 5.3.1, 5.3.2 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administr ator can enable or disable the Malware Protection feature for the member accounts in the organizat ion. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Malware Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | 10.2.1, 10.4.1, 10.4.1.1, 5.2.3 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the RDS Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty RDS Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | 10.7.2, 11.5.1, 5.3.2 | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | 10.2.1, 10.4.1, 10.4.1.1, 5.2.3 | Amazon GuardDuty S3 Protection analyzes S3 data-plane events (such as GetObject, PutObject, and DeleteObject) to detect potentially malicious or anomalous access to your S3 data, including credential misuse and data exfiltration. Enabling S3 Protection extends GuardDuty threat detection to your object storage so suspicious activity against sensitive data can be identified and investigated promptly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-external-access-analyzer-enabled | 7.2.4 | Enabling an IAM Access Analyzer external access analyzer continuously identifies resources that are shared with external principal s, such as other accounts, federated users, or the public. This helps you detect and remediate unintended external access, enforcing least privilege and reducing the risk of data exposure. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-password-policy | 8.3.10.1, 8.3.6, 8.3.7, 8.3.9, 8.6.3 | Strong password policies are essential for protecting AWS accounts from unauthorized access through credentia l-based attacks. Enforcing strong password requireme nts significantly reduces the risk of password guessing, brute force attacks, and credential theft. Weak password policies create security vulnerabi lities that can lead to account compromis e, data breaches, and compliance violation s. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | 7.2.1, 7.2.2, 7.2.3, 7.2.5 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | 7.2.2, 7.2.5 | To ensure the confidentiality, integrity and availability of AWS resources from accidental or malicious activity, IAM policies containing full administrative privileges must not be permitted. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| iam-policy-no-statements-with-full-access | 7.2.2, 7.2.5 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-mfa-enabled | 8.4.1, 8.4.2, 8.4.3 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-no-policies-check | 7.2.2, 7.2.3, 7.2.5 | By validating that policies are not attached to user, group, or role resource types, mitigation of risks of unauthorized access, privilege escalation, or policy violations can be mitigated and ensure compliance with least privilege principles applicable to security best practices and regulatory compliance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-user-unused-credentials-check | 8.2.6 | Unused IAM credentials can pose security risks if compromised. This identification will facilitate the removal of credentials to reduce the risk of unauthorized access to AWS resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| restricted-ssh | 1.3.1 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | 11.3.1, 6.3.1 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | 11.3.1, 11.3.1.1, 11.3.1.2, 6.3.1 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-code-scan-enabled | 11.3.1, 6.2.3, 6.3.1 | Amazon Inspector Lambda code scanning scans the custom application code within an AWS Lambda function for code vulnerabilities based on AWS security best practices. Lambda code scanning can detect injection flaws, data leaks, weak cryptography, or missing encryption in your code. This feature is available in specific AWS Regions only. You can activate Lambda code scanning together with Lambda standard scanning (see Inspector.4 Amazon Inspector Lambda standard scanning should be enabled). | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | 11.3.1, 11.3.1.2, 6.2.3, 6.2.4 | Standard Lambda scanning is essential for maintaining security in serverless architectures. Without regular scanning, organizations may miss potential vulnerabilities in their Lambda runtime environments. Implementing standard scanning helps ensure comprehensive Lambda function security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| internet-gateway-authorized-vpc-only | 1.3.1, 1.3.2 | This control provides a mechanism that forces attention on which VPC(s) should be allowed to access the public internet. This control will require the appropriate VPC(s) to be identified and labeled as approved for internet accesses through use of an IGW. Failure to identify and validate the list of authorized VPC's could cause unintended access to AWS resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | 12.5.1 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | 12.5.1 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-gateway-tagged | 12.5.1 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | 12.5.1 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | 12.5.1 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industrial IoT initiatives. Without proper tagging, organizations may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | 2.2.1 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | 7.2.5, 7.2.6 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | 3.5.1 | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | 3.2.1 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| kinesis-stream-encrypted | 2.2.1 | Ensuring encryption is enabled for Kinesis data streams at rest reduces the likelihood of unintentional data exposure and reduces the risk of a data breach. Server side encryption is available in Kineses to perform this function. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| kms-key-policy-no-public-access | 3.6.1, 3.6.1.3, 7.2.1, 7.3.1 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-public-access-prohibited | 1.4.4, 7.2.2, 7.2.5 | Lambda function resource policies should not be publicly accessible to prevent unrestricted access to the code stored in the Lambda function. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| mfa-enabled-for-iam-console-access | 8.4.1, 8.4.2, 8.4.3 | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | 8.2.1 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-automatic-minor-version-upgrade-enabled | 6.3.3 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-auto-minor-version-upgrade-enabled | 6.3.3 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | 10.2.1 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-logging-enabled | 10.2.1 | Audit logging for Amazon MQ brokers provides detailed trails of activities and connections, useful for security monitoring and forensic investigations. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-cloudwatch-audit-log-enabled | 10.2.1 | Audit logging for Amazon MQ brokers provides detailed trails of activities and connections, useful for security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | 1.4.4 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastru cture. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderaba d), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | 1.3.1, 1.4.1, 1.4.2, 1.4.4 | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-cluster-tagged | 12.5.1 | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | 10.2.1 | Enabling logging for MSK Connect connectors is essential for operational visibility, troubleshooting, and security monitoring. Logs provide critical insights into connector performance, data processing activities, error conditions, and potential security events. Without proper logging, organizations lose the ability to effectively monitor data pipeline operations, diagnose issues, meet compliance requirements for audit trails, and detect suspicious activities or data processing anomalies. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-in-cluster-node-require-tls | 4.2.1 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulat e network traffic. Encrypting data in transit also reduces the risk of unauthori zed access and data loss. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | 7.2.1, 8.3.1 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| multi-region-cloud trail-enabled | 10.2.1, 10.2.1.2 | Enabling AWS CloudTrail trails in all regions provides comprehensive visibility, compliance adherence, incident response capabilit ies, and proactive security monitorin g. It ensures that no region is left unmonitored, reducing the risk of undetected security incidents and enabling effective security management across the entire AWS infrastructure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nacl-no-unrestricted-ssh-rdp | 1.3.1 | Network access control list (NACL) should not allow unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| neptune-cluster-encrypted | 2.2.1, 3.5.1 | Encrypting Amazon Neptune clusters at rest protects the confidentiality and integrity of data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-snapshot-encrypted | 2.2.1 | Enabling encryption at rest for Amazon Neptune DB cluster snapshots protects the data against unauthorized access to sensitive data, and helps achieve compliance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-deletion-protection-enabled | 1.2.8 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that enables you to inspect and filter traffic to, from, or between the Virtual Private Clouds (VPCs). The deletion protection setting protects against accidental deletion of the firewall. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-logging-enabled | 10.4.2 | Enabling firewall logging for AWS Network Firewall gives detailed information about network traffic, including the time that the stateful engine received a packet flow, detailed information about the packet flow, and any stateful rule action taken against the packet flow. | Available in all commercial Regions except Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | 2.2.1 | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | 1.2.1, 1.2.2, 1.4.1 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewalls subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | 1.3.1, 1.4.1, 1.4.2, 1.4.4 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | 12.5.1 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-logging-enabled | 10.2.1 | Access logging for Network Load Balancers provides detailed records of requests sent to the load balancer, including client IP addresses, latencies , request paths, and server responses. This logging capability is essential for security monitoring, troublesh ooting performan ce issues, analyzing traffic patterns, and meeting complianc e requirements. Without access logging enabled, organizations lose visibility into network traffic patterns and may be unable to detect security incidents, perform forensic analysis, or troubleshoot connectivity issues effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| no-unrestricted-route-to-igw | 1.3.2 | Restricting access to the IGW enhances the security of EC2 instances by protecting sensitive data and reduces the potential for data breaches or unauthorized activities. Restricting access to the IGW aligns with the principle of least privilege and allows for implementation of network segmentation and isolation strategies by controlling outbound connections creating communication boundaries between different parts of network infrastructure reducing the occurrence of lateral movement of threats, limits the impact of potential security incidents, and enhances overall network security and resilience. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-access-control-enabled | 7.2.2, 7.2.5 | Enabling fine-grained access controls in Amazon OpenSearch service domains ensures data security, compliance, least privilege, data governance, auditing capabilities, and controlled access, while protecting sensitive data to mitigate risks and maintain data integrity. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-audit-logging-enabled | 10.2.1 | Configuring Amazon OpenSearch to send logs to CloudWatch logs provides a centralized, scalable, and provides a solution for log management, monitoring, troubleshooting and integration where CloudWatch provides log retention polices and encryption with fine grained access controls that will meet security and regulation requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-encrypted-at-rest | 2.2.1 | Configuring encryption at rest for OpenSearch is crucial to ensure the security and confidentiality of your data. By encrypting data at rest, you protect it from unauthorized access and potential breaches, mitigating the risk of data exposure. This essential security measure helps maintain compliance with industry standards and regulations, building trust with users and safeguarding your organization's reputation. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-https-required | 2.2.1 | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-in-vpc-only | 1.4.4, 7.2.2, 7.2.5 | Placing OpenSearch domains in a VPC provides network isolation by separating them from the public internet to protect them from unauthorized access and prevent potential security threats through network access control lists (ACLs), and security groups defense in-depth security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-node-to-node-encryption-check | 2.2.1 | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-update-check | 6.3.3 | Configuring the latest updates for Amazon OpenSearch service domains helps to improve security, optimize performance, maintain compatibility with other systems, and address known bugs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-mysql-audit-logging-enabled | 10.2.1 | Publishing audit logs to CloudWatch Logs enables centralized log aggregation, analysis, and monitoring. This facilitates security monitoring, incident response, and compliance reporting by providing visibility into database activities and potential security events. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-aurora-postgresql-logs-to-cloudwatch | 10.2.1, 10.2.1.2 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-automatic-minor-version-upgrade-enabled | 6.3.3 | AWS RDS will occasionally deprecate minor engine versions and provide new ones for an upgrade. When the last version number within the release is replaced, the version changed is considered minor. With Auto Minor Version Upgrade feature enabled, the version upgrades will occur automatically during the specified maintenance window so your RDS instances can get the new features, bug fixes, and security patches for their database engines. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-auto-minor-version-upgrade-enable | 6.3.3 | Keeping Amazon Relational Database Service (RDS) clusters up-to-date with the latest minor database engine version ensures timely application of security patches and bug fixes released by AWS. This reduces the possible risk of known vulnerabilities being exploited and maintains a secure and stable database environment. | Available in all commercial Regions except US West (N. California), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| rds-cluster-default-admin-check | 2.2.6 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-cluster-encrypted-at-rest | 2.2.1 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| rds-cluster-iam-authentication-enabled | 7.3.1 | IAM database authentication allows users to authenticate to database instances with an authentication token instead of a password, to reduce the risk of use of compromised user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| rds-db-security-group-not-allowed | 1.3.2 | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. This includes blocking traffic to and from 0.0.0.0/0. | Available only in US East (N. Virginia), US West (N. California), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Ireland), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-default-admin-check | 2.2.6 | Create a custom, unique alphanumeric string for the master user to manage RDS database clusters and instances, instead of the default "awsuser" as a master username, to reduce the risk of unauthorized or unintended access and to protect your organization's data. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| rds-instance-iam-authentication-enabled | 7.3.1 | IAM database authentication allows users to authenticate to database instances with an authentication token instead of a password, to reduce the risk of use of compromised user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-public-access-check | 1.4.4 | Blocking public access to RDS instances helps keep data safe from unauthorized access, reduces the risk of malicious activitie s, and prevents unnecessary threats. In addition, and if publicly exposed, any brute force attempts logins will lower the database performan ce. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-subnet-igw-check | 1.4.4 | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-logging-enabled | 10.2.1 | Enabling logging for RDS helps monitor the environment to detect potential suspicious activity and unauthorized access to data. Amazon RDS logs are sent to CloudWatch for redundancy. RDS logging provides a mechanism for maintaining reliability, availability and performance of Amazon RDS. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | 4.1.1, 4.2.1 | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | 4.1.1, 4.2.1 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your applicati on. Data may move across the internet or within a private network. Encryptin g data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | 10.2.1, 10.2.1.1, 10.2.1.2, 10.2.1.3, 10.2.1.4, 10.2.1.5, 10.2.1.7 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgres-instance-encrypted-in-transit | 4.1.1, 4.2.1 | Data in transit refers to data that moves from one location to another, such as between nodes in your cluster or between your cluster and your application. Data may move across the internet or within a private network. Encrypting data in transit reduces the risk that an unauthorized user can eavesdrop on network traffic. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | 4.2.1 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-snapshot-encrypted | 2.2.1 | Enabling encryption at rest for RDS cluster snapshots and RDS database protects your data against unauthorized access to sensitive data and helps achieve compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | 4.1.1, 4.2.1 | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | 10.2.1, 10.2.1.1, 10.2.1.2, 10.2.1.3, 10.2.1.4, 10.2.1.5, 10.2.1.7 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-storage-encrypted | 3.5.1 | Amazon RDS encrypted DB instances provide an additional layer of data protection by securing your data from unauthorized access to the underlying storage. You can use Amazon RDS encryption to increase data protection of your applications deployed in the cloud, and to fulfill compliance requirements for encryption at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-audit-logging-enabled | 10.2.1 | Enabling audit logging allows for the recording of activity occurring in Amazon Redshift clusters to CloudWatch or S3. This information can be used for analytics, monitoring, alerting, anomaly detection or for use in investigating security events. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| redshift-cluster-configuration-check | 10.2.1, 2.2.1 | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-kms-enabled | 2.2.1 | Encrypting Redshift clusters at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-maintenancesettings-check | 6.3.3 | Updating with the latest security patches and bug fixes reduces vulnerabilities and increases stability. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-cluster-public-access-check | 1.4.4 | Publicly accessible Redshift clusters are assigned a public IP address and exposed to the Internet. Unless you intend for your cluster to be publicly accessible, the cluster should not be configured with PubliclyAccessible set to True. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-default-admin-check | 7.2.2, 7.2.5 | Default credential should be changed after initial setup, to reduce the risks of unauthorized access and potential data breaches due to default or shared credentials. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| redshift-default-db-name-check | 2.2.6 | Changing default database name at cluster creation obfuscates access, reducing potential for external or unintended entry into the database. Default names are public knowledge and should be changed upon configuration. As an example, a well-known name could lead to inadvertent access if it was used in IAM policy conditions. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-require-tls-ssl | 4.2.1 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-default-db-name-check | 2.2.2 | Using custom database names instead of default values enhances security by reducing predictability for potential attackers and supports better organizational practices. Default database names are well-known and can be easily guessed, potentially increasing the attack surface. Custom naming also improves operational management by making it easier to identify and organize databases according to business requirements, environments, or applications, while supporting compliance requirements that mandate unique identifiers for database resources. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Mexico (Central), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | 10.2.1, 10.2.1.1, 10.3.3 | Publishing Redshift Serverless logs to CloudWatch Logs enables comprehensive monitoring, troubleshooting, and security analysis of database activities. Log data provides visibility into query performance, connection attempts, user activities, and potential security events. This logging capability is essential for operational monitoring, performance optimization, compliance requirements, and security incident response. Without proper logging, organizations lose critical visibility into database operations and may struggle to detect unauthorized access attempts or performance issues. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | 4.1.1, 4.2.1 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | 1.3.1, 1.4.2 | When a Redshift Serverless workgroup is publicly accessible, its endpoint can be reached from the internet, increasing the risk of unauthorized access and data exfiltration. Disabling public access restricts connectivity to your VPC and trusted networks, reducing the attack surface of the data warehouse. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | 1.3.1 | Routing Redshift Serverless workgroup traffic through a VPC provides essential network isolation and security controls. VPC routing enables organizations to implement network-level access controls, monitor traffic patterns, and maintain compliance with security frameworks that require private network configurations. This control helps prevent unauthorized external access to data warehouse resources and ensures that sensitive data processing occurs within a controlled network environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-unrestricted-port-access | 1.3.1, 1.3.2, 1.4.4 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implement ing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| required-tags | 2.2.1 | Tags can help you manage, identify, organize, search for, and filter resources. Tagging can also be used to create new resource construct s for visibility or control (such as grouping together resources that make up a micro-service, application, or workload). Tagging is fundamental to providing enterpris e-level visibility and control. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-common-ports | 1.3.1 | Using the default VPC security group does not provide appropriate control over inbound and outbound traffic and can lead to excessive access permissions and data leakage. Not restricting access to ports to only authorized users, can lead to attacks against the availabil ity, integrity and confidentiality of systems. Security Group configurations should not allow ingress traffic from 0.0.0.0, but instead should specify trusted sources per port. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | 8.4.1, 8.4.2, 8.4.3 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentials making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | 8.4.1, 8.4.2, 8.4.3 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | 12.5.1 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | 12.5.1 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-query-logging-enabled | 10.4.2 | Enabling logging includes information such as the domain or subdomain that was queried, the date and time of the query, the DNS record type, and the DNS response code. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| s3-access-point-in-vpc-only | 1.3.1, 1.4.1, 1.4.2 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-public-access-blocks | 1.4.4, 7.2.2, 7.2.5 | Enabling block public access for Amazon S3 access points enhances security by preventing unauthorized access from the public internet, mitigating the risk of data breaches, and ensuring compliance with security best practices and regulatory requirements. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks | 1.4.2 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | 1.4.2 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-default-lock-enabled | 10.5.1 | S3 Object lock mitigates the risk of accidental loss of data being deleted or overwritten. This will ensure that Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Since sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | 1.4.2 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-logging-enabled | 10.2.1 | Enabling S3 bucket logging on target S3 buckets allows you to capture all events that might affect objects in a target bucket. Configuring logs to be placed in a separate bucket enables access to log information, which can be useful in security and incident response workflows and provides redundancy. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-policy-grantee-check | 7.2.2, 7.2.5 | S3 bucket policies help achieve more specific access permissions and authorizations to keep data protected from unauthorized users. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-read-prohibited | 1.4.2, 1.4.4, 7.2.2, 7.2.5 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | 1.4.2, 1.4.4, 7.2.2, 7.2.5 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| s3-bucket-server-side-encryption-enabled | 2.2.1 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-ssl-requests-only | 4.2.1 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-tagged | 12.5.1 | Tagging S3 buckets is essential for effective resource managemen t, cost allocation, and governance. Tags enable organizat ions to categorize buckets by purpose, owner, environment, or project, facilitat ing accurate cost tracking and billing. Proper tagging also supports automated resource managemen t, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-default-encryption-kms | 2.2.1 | Protecting objects in S3 using encryption at rest with KMS prevents unauthorized access of data at rest and reduces the risk of a potential data breach or related security incident. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | 3.2.1 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-in-logically-air-gapped-vault | 1.4.4 | Logical air-gapping is essential for protecting critical S3 data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical S3 bucket data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | 3.2.1 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | 1.3.1 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | 12.5.1 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-configuration-kms-key-configured | 2.2.1 | Enabling encryption with AWS KMS protects data at rest in Amazon SageMaker, making it difficult for unauthorized individuals to access or manipulate the data. AWS KMS provides centralized key management, facilitating the management of keys and their lifecycle. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | 12.5.1 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | 1.4.2, 1.4.4 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | 1.3.1, 1.4.1, 1.4.2, 1.4.4 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| sagemaker-notebook-instance-inside-vpc | 2.2.1 | Deploying Amazon SageMaker notebook instances within a custom VPC enables network access control through security groups, network ACLs, routing tables, and other VPC security features. This isolates the instances and restricts unauthorized access, reducing potential attack surfaces. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-kms-key-configured | 2.2.1 | Sensitive information can be stored on the storage volumes attached to Amazon SageMaker notebook instance. Amazon KMS key ensures that the data at rest is encrypted. Encryption of data-at-rest is a recommended best practice to add a layer of access management around your data. In case of any compromise to your SageMaker resources, encryption-at-rest ensures that you data is protected from unintended access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-root-access-check | 7.2.2, 7.2.5 | Disabling root access to Amazon SageMaker notebook instances limits the ability to perform unrestricted operations on the instance, reducing the risk of unintended changes, data breaches, or system compromise due to excessive permissions. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| sagemaker-notebook-no-direct-internet-access | 1.4.4 | Amazon SageMaker notebook instances direct internet access should be disabled to avoid exposure of data to the public internet and reduce the likelihood of threat vectors such as brute force and distributed denial-of-service attacks. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| secretsmanager-rotation-enabled-check | 8.3.10.1, 8.3.9, 8.6.3 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-scheduled-rotation-success-check | 8.3.10.1, 8.3.9, 8.6.3 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-secret-periodic-rotation | 8.3.10.1, 8.3.9, 8.6.3 | Rotating secrets minimizes the consequences of a leaked secret and prevents bad actors from gaining unauthorized access to systems. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| secretsmanager-secret-unused | 8.3.10.1, 8.3.9, 8.6.3 | Deleting unused secrets ensures that access to secrets is revoked from users who no longer need it and reduces usage cost of the Secrets Manager service. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| secretsmanager-using-cmk | 8.3.2 | By using customer managed keys to encrypt secrets, customers can control and restrict access to the keys and protect the confidentiality of information. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| securityhub-enabled | 10.4.2 | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | 12.5.1 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | 7.2.2, 7.3.1 | Portfolio sharing only within Organizations helps ensure that a portfolio isnt shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub recommends using ORGANIZATIONMEMBER ACCOUNT instead of ACCOUNT. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ses-malware-scanning-enabled | 5.3.2 | Malware scanning in SES is crucial for protecting email workflows from potential security threats. Without scanning, malicious attachments or spam could infiltrate your systems. Implementing malware scanning helps maintain email security and prevents potential infections. | Available only in US East (N. Virginia), US West (Oregon), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| sns-encrypted-kms | 2.2.1 | Encrypting data at rest reduces the risk of data stored on disk being accessed by unauthenticated users. This adds a data protection layer from a threat actor attempting to gain unauthorized access to SNS topic data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sns-topic-no-public-access | 7.2.2, 7.3.1 | An Amazon SNS topic access policy that allows public access lets any AWS principal , or anonymous users, publish to or subscribe to the topic, which can lead to unauthorized message injection, information disclosure, and abuse. Restricting the topic policy to specific trusted principals enforces least privilege and protects the confidentiality and integrity of messages. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | 7.2.1, 7.2.2, 7.3.1, 7.3.3 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | based application architectures. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | 7.2.1, 7.2.2, 7.3.1, 7.3.3 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | 7.2.1, 7.2.2, 7.3.1, 7.3.3 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | 10.1.1, 10.2.1, 10.2.2 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-document-not-public | 1.4.4, 7.2.2, 7.2.5 | Removing public access prevents unwanted disclosure of your SSM documents. Public access to a SSM documents can lead to unintended exposure of valuable information about AWS account(s), resources, and internal processes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| storagegateway-resources-in-logically-air-gapped-vault | 1.4.4 | Logical air-gapping is essential for protecting critical Storage Gateway data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical Storage Gateway volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| subnet-auto-assign-public-ip-disabled | 1.4.4 | Automatically assigning public IPv4 addresses within a VPC subnet exposes instances directly to the Internet which can lead to external security attacks. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-connector-logging-enabled | 10.1.1, 10.2.1, 10.2.1.1, 10.2.1.2, 10.4.1 | Enabling CloudWatch logging for AWS Transfer Family Connectors is essential for maintaining operational visibility, security monitoring, compliance requirements. Comprehensive logging enables organizations to track file transfer activities, monitor connector performance, detect anomalous behavior, maintain audit trails for regulatory compliance. Without proper logging, organizations lose critical visibility into data transfer operations, making it difficult to troubleshoot issues, investigate security incidents, or demonstrate compliance with data governance requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), and Europe (Zurich). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | 4.2.1 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-default-security-group-closed | 1.3.2 | Default VPCs and any VPCs that are created come with a default security group. With some resources , default security group is automatic ally assigned if the resource is created without specifying a custom security group. Default security group outbound/inbound rule allows all traffic and this can increase opportunities for malicious activity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-flow-logs-enabled | 10.4.2 | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. These logs can be used to respond quickly to anomalous traffic and can aid in incident response investigations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| vpc-network-acl-unused-check | 1.2.7 | Having unused network Access Control Lists (ACLs) increases the risk of unauthorized access to VPC EC2 resources and should be removed once not needed any longer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-open-only-to-authorized-ports | 1.3.1, 1.3.2 | High risk ports are often exposed to the Internet and easily exploitable by attackers. Security groups provide stateful filtering of ingress and egress network traffic to AWS. Security group rules should follow the principal of least privileged access. Unrestricted access (IP address with a /0 suffix) increases the opportunity for malicious activity such as hacking, denial-of-service attacks, and loss of data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | 1.3.1, 1.4.2 | Controlling inbound access to sensitive ports is crucial for maintaining network security. Unrestricted access to ports like SSH (22) or RDP (3389) could lead to unauthorized system access and potential breaches. Implementing strict port access controls helps prevent unauthorized access to resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-logging-enabled | 10.4.2 | Activity logs generated by Web ACL, in AWS Web Application Firewall actions, can provide useful operational troubleshooting and improvement information to application owners, looking to improve the underlying applications protected by the WAF service. The logs can also be beneficial if false positive blocking actions have been reported. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-rulegroup-not-empty | 6.4.2 | AWS WAF rule groups must contain rules to be effective in filtering web requests based on conditions defined in the rules. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| wafv2-webacl-not-empty | 6.4.2 | Web access control lists (ACLs) without any configured rules or rule groups will not perform traffic inspection or filtering, allowing all web traffic to pass through unchecked. Configuring rules or rule groups enables enforcement of web application security policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-classic-logging-enabled | 10.4.2 | Activity logs generated by Web ACL, in AWS Web Application Firewall actions, can provide useful operation al troubleshooting and improveme nt information to application owners, looking to improve the underlying applicati ons protected by the WAF service. The logs can also be beneficia l if false positive blocking actions have been reported. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-rulegroup-not-empty | 6.4.2 | AWS Web Application Firewall (WAF) Classic global rule groups, without any configured rules, will not inspect or filter web traffic, potentially allowing malicious or unauthorized traffic to pass through. Configuring rules enables traffic inspection and enforcement of security policies. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| waf-global-rule-not-empty | 6.4.2 | A WAF uses Web ACLs to help protect web applications by filtering and monitoring HTTP(S) traffic between a web application and an untrusted network to control how your protected resources respond to HTTP(S) web requests. WAF rules and rule groups define how to inspect HTTP(S) web requests and the action to take on a request when it matches the inspection criteria. This helps protect your resources from potential attacks, vulnerabilities, and unauthorized access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| workspaces-root-volume-encryption-enabled | 3.5.1, 3.6.1 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | 3.5.1, 3.6.1 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

## SOC 2 - AICPA Trust Services Criteria

This AWS Config managed conformance pack provides a curated mapping between the System and Organization Controls (SOC) 2 Trust Services Criteria (SSAE 18, October 2023) criteria and AWS Config managed rules. Each Config rule evaluates specific AWS resources and is associated with one or more SOC 2 criteria. AWS Config maintains and automatically updates the managed conformance pack as supported rules and resource types evolve. Refer to the table below for details on the rules, associated controls, guidance, and AWS Region availability.

**Source identifier:** SOC-2_2023

This conformance pack is available in all commercial AWS Regions (Regions other than the AWS GovCloud (US) Regions and the China Regions). It's also available in AWS GovCloud (US) Regions.

This conformance pack contains up to 290 AWS Config managed rules. The rules deployed vary by Region. The following table lists each rule, its control IDs, guidance, and the Regions where it's available. To see details about a rule, choose its name.

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-http-to-https-redirection-check | CC6.7 | By forcing redirecti on from HTTP to the secure HTTPs protocol, data is encrypted in transit in both directions: going to and coming from the origin server to maintain confident iality and prevent malicious actors from unauthorized access to sensitive data such as user credentials. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| alb-internal-scheme-check | CC6.1, CC6.6 | Internal scheme configuration for Application Load | Available in all commercial Regions except Asia Pacific |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | Balancers is critical for maintaining network security boundaries and implementing defense-in-depth strategies. Load balancers with internal schemes are only accessible from within the VPC, preventing direct internet exposure of internal applicati ons and services. This configura tion helps protect sensitive workloads from external threats, reduces the attack surface, and ensures that traffic routing occurs through controlled network pathways. Organizations often require internal load balancers to comply with security frameworks and regulatory requireme nts that mandate network segmentat ion and controlled | (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | access to application infrastructure. | |
| alb-listener-tagged | CC2.1, CC6.1 | Proper tagging of ALB listeners enables effective resource management, cost allocation, and governance across cloud environments. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking per business unit or project, and ensure adherence to organizational tagging policies. Consistent tagging practices improve operational visibility and enable automated resource lifecycle management through tag-based policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| alb-tagged | CC2.1, CC6.1 | Proper tagging of Application Load Balancers enables effective resource management, cost allocation, access control, and compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, and maintaining operational visibility across environments. Consistent tagging practices support security incident response, cost optimization initiatives, and regulatory compliance requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-associated-with-waf | CC6.6 | Without WAF association, Amazon API Gateway is vulnerable to malicious web attacks such as SQL-Injection and Cross-site Scripting. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-execution-logging-enabled | CC7.2 | Execution logging for API Gateway stages provides critical visibility into API usage patterns, error conditions, and potential security incidents. Without proper logging enabled, organizations lose the ability to audit API activity, troubleshoot issues, detect unauthorized access attempts, and maintain compliance with security requirements. Comprehensive logging is essential for effective incident response, forensic analysis, and maintaining an audit trail of all API interactions. | Available in all commercial Regions except Asia Pacific (New Zealand) and Asia Pacific (Taipei). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-rest-api-tagged | CC2.1, CC6.1 | Proper tagging of API Gateway REST APIs is essential for resource management, cost allocation, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or business unit, facilitating accurate cost tracking and billing. They also support automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource ownership and usage patterns, making it difficult to manage costs, implement governance policies, and maintain operational control over their API infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| api-gw-stage-tagged | CC2.1, CC6.1 | Proper tagging of API Gateway stages enables effective resource managemen t, cost allocation, access control, and operational visibilit y. Tags provide essential metadata for organizing resources, implement ing automated governance policies, tracking resource ownership, and maintaining compliance with organizational standards. Consisten t tagging practices facilitate resource discovery, cost optimization, and security monitoring across API Gateway deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-application-tagged | CC6.1 | Resource tagging is essential for effective resource management, inventory, cost tracking, and security controls in AWS environments. Without proper tagging, organizations cannot effectively track resource ownership, allocate costs, or implement tag-based access controls. Well-structured tagging enables automated resource management and compliance monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-tagged | CC6.1 | Proper tagging of configuration profiles is crucial for maintaining organizational consistency and operational oversight. Tags facilitate resource tracking, access management, and cost allocation. Without structured tagging, organizations risk losing visibility and control over their configuration profiles. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-configuration-profile-validators-not-empty | CC8.1 | Configuration validators are essential for ensuring that deployed configurations function as intended and meet quality standards. Validators perform syntactic checks to verify proper formatting and semantic checks to validate business logic, preventing deployment of malformed or incorrect configurations that could cause application failures, security vulnerabilities, or operational issues. This control helps maintain configuration integrity and reduces the risk of deploying faulty configurations to production environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-environment-tagged | CC6.1 | Tagging environments is vital for maintaining organizational structure, tracking resource usage and implementing security controls. Without proper tagging, organizations may struggle with resource attribution, cost management, and enforcing access policies across different environments. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appconfig-extension-association-tagged | CC6.1 | Tagging extension associations is crucial for maintaining visibility and control over resource relationships. Proper tagging facilitates easier management, aids in cost attribution, and supports granular access controls. Without structured tagging, organizations may face challenges in tracking and managing their AppConfig extension associations effectively. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appintegrations-event-integration-tagged | CC2.1, CC6.1 | Proper tagging of AppIntegrations event integrations is essential for resource management, cost allocation, access control, and operational governance. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows and compliance reporting. Consistent tagging practices improve visibility into resource usage, support accurate cost tracking and billing allocation, and enable effective resource lifecycle management across integration workflows. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-gateway-route-tagged | CC6.1 | Tagging gateway routes is essential for maintaining clear visibility and control over network traffic configurations. Proper tagging enables efficient resource management, accurate cost allocation, and granular access controls. Without structured tagging, organizations may struggle to effectively manage and secure their App Mesh gateway routes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-deny-tcp-forwarding | CC6.1, CC6.6 | Preventing TCP forwarding to services without proxies is critical for maintaining service mesh security and observability. When egress filtering is set to 'ALLOW ALL', traffic can bypass the mesh's security controls, encryption, and monitoring capabilities by communicating directly with services that lack proper proxy configuration. This creates security gaps, reduces visibility into service-to-service communications, and undermines the mesh's ability to enforce policies, collect telemetry, and provide traffic management features. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-mesh-tagged | CC6.1 | Proper tagging of service meshes is crucial for maintaining operational visibility, inventory and control. Tags enable effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations risk losing oversight of their service mesh infrastructure and associated resources. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-route-tagged | CC6.1 | Tagging routes is essential for maintaining clear visibility and control over service mesh traffic patterns. Proper tagging supports efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations may face difficulties in managing and securing their App Mesh route configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-backend-defaults-tls | CC6.1, CC6.7 | Enforcing TLS communication in App Mesh virtual gateway backend defaults ensures data in transit is encrypted between the gateway and backend services, protecting against eavesdropping and man-in-the-middle attacks. This control helps maintain data confidentiality and integrity across service mesh communications, supports compliance with security frameworks that require encryption in transit, and establishes a secure-by-default posture for service-to-service communications within the mesh infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-logging-file-path-exists | CC7.1, CC8.1 | Access logging is essential for monitoring traffic patterns, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Virtual gateways serve as entry points to the mesh and handle external traffic, making comprehensive logging critical for detecting anomalous behavior, performance issues, and potential security threats. Proper log file path configuration ensures that access logs are consistently captured and stored in designated locations for analysis, compliance reporting, and incident response activities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-gateway-tagged | CC6.1 | Tagging virtual gateways is crucial for maintaining operational control and visibility. Proper tagging enables efficient resource tracking, cost allocation, and access management. Without structured tagging, organizations risk losing oversight of their gateway configurations and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-backend-defaults-tls-on | CC6.1, CC6.7 | Enforcing TLS communication as the default for App Mesh virtual node backends is critical for maintaining data confidentiality and integrity in service mesh communications. This control helps ensure that all inter-service communication is encrypted by default, reducing the risk of data interception, man-in-the-middle attacks, and unauthorized access to sensitive information transmitted between microservices. Consistent TLS enforcement also supports compliance with security frameworks and regulatory requirements that mandate encryption of data in transit. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-logging-file-path-exists | CC7.1, CC8.1 | Access logging is essential for monitoring application traffic, troubleshooting connectivity issues, and maintaining security visibility within service mesh environments. Without a properly configured log file path, organizations lose critical observability data needed for performance analysis, security incident response, and compliance auditing. Ensuring all App Mesh virtual nodes have designated log file paths enables consistent log collection and supports effective monitoring of service-to-service communications. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-node-tagged | CC6.1 | Proper tagging of virtual nodes is essential for maintaining clear visibility and control over service mesh resources. Tags facilitate effective resource management, cost tracking, and access control implementation. Without structured tagging, organizations may struggle to manage and secure their virtual node configurations effectively. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-router-tagged | CC6.1 | Tagging virtual routers is crucial for maintaining operational visibility and control over traffic routing. Proper tagging enables efficient resource management, accurate cost attribution, and granular access controls. Without structured tagging, organizations risk losing oversight of their routing infrastructure and associated security controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appmesh-virtual-service-tagged | CC6.1 | Tagging virtual services is essential for maintaining operational control and visibility. Proper tagging facilitates resource management, cost allocation, and access controls. Without structured tagging, organizations may face challenges in managing and securing their virtual service configurations. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-in-vpc | CC6.1, CC6.6 | Routing App Runner service egress traffic through a custom VPC provides enhanced network security and control capabilities. Custom VPC configuration enables organizat ions to implement network-level security controls such as security groups, network ACLs, and VPC endpoints. It also allows for better network monitorin g, traffic inspectio n, and compliance with organizational network policies. Additionally, VPC routing facilitates secure connectivity to private resources and enables more granular control over outbound internet access through NAT gateways and route tables. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-no-public-access | CC6.6 | Preventing public accessibility of AppRunner services reduces the attack surface and minimizes exposure to internet-based threats. Services that do not require public internet access should be configured with private network access to implement defense-in-depth security principles. This control helps organizations maintain network segmentation, comply with security frameworks that require private service deployment, and reduce the risk of unauthorized access to application workloads. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| apprunner-service-observability-enabled | CC7.1 | Enabling observability for App Runner services is essential for maintaining operational visibility, performance monitoring, and troubleshooting capabilities. Observability features provide critical insights into application performance, request tracing, and system health metrics. Without proper observability configuration, organizations lose visibility into application behavior, making it difficult to detect performance issues, security incidents, or operational problems. This monitoring capability supports incident response, performance optimization, and compliance requirements by ensuring comprehen | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | sive logging and monitoring coverage across containerized applications. | |
| appstream-fleet-in-vpc | CC6.1, CC6.6 | Deploying AppStream 2.0 fleets within a VPC provides enhanced network security and isolation capabilities. VPC deployment enables administrators to implement granular network access controls, security groups, and network ACLs to restrict traffic flow. This configuration supports compliance with security frameworks that require network segmentation and helps prevent unauthorized access to streaming resources and underlying infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-ct-encryption-at-rest | CC6.1 | Encryption at rest is a critical security control for protecting cached API data. Unencrypted cache data could be vulnerable to unauthorized access if storage is compromised. Implementing encryption provides an essential layer of defense for sensitive information. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| appsync-cache-ct-encryption-in-transit | CC6.1, CC6.7 | Encryption in transit is crucial for protecting data as it moves between services and components. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks or unauthorized interception. Implementing transit encryption safeguards data confidentiality and integrity. | Available only in US East (N. Virginia), Europe (Frankfurt), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-cache-encryption-at-rest | CC6.1 | Encryption at rest is essential for protecting GraphQL API data from unauthorized access. Unencrypted API data could be vulnerable to security breaches if storage systems are compromised. Implementing encryption adds a crucial layer of data protection. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-graphql-api-xray-enabled | CC7.2 | Enabling AWS X-Ray tracing on AppSync GraphQL APIs provides critical visibility into application performance, request flows, and potential bottlenecks across distributed systems. X-Ray tracing helps identify performance issues, debug errors, and understand service dependencies, which is essential for maintaining application reliability and optimizing user experience. This monitoring capability also supports compliance requirements for application observability and helps detect anomalous behavior patterns that could indicate security issues. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| appsync-logging-enabled | A1.1 | Enabling logging for AWS AppSync GraphQL APIs provides critical visibility into API operations, request patterns, and potential errors. Without proper logging, troubleshooting issues becomes significantly more difficult, potentially leading to extended outages, security incidents going undetected, and inability to audit API usage. Logs are essential for debugging, performance monitoring, and maintaining operational awareness of your GraphQL API endpoints. | Available in all commercial Regions except Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-encrypted-at-rest | CC6.1 | Encrypting Athena query results at rest with AWS KMS keys provides enhanced data protection for potentially sensitive information. Without encryption, query results stored in S3 may be vulnerable to unauthorized access if bucket permissions are compromised. KMS encryption adds a critical security layer by ensuring that even if the underlying storage is accessed, the data remains protected through cryptographic controls, helping organizations meet compliance requirements and safeguard sensitive data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-enforce-workgroup-configuration | CC6.1 | Enforcing workgroup configuration settings is essential for maintaining consistent security policies, cost controls, and query execution standards across an organization. When workgroup configuration enforcement is disabled, individual users can override important settings such as query result encryption, output locations, and resource limits, potentially leading to security vulnerabilities, compliance violations, and unexpected costs. This control helps ensure that centrally defined governance policies are consistently applied regardless of client-side configurations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| athena-workgroup-logging-enabled | CC2.1, CC7.2 | Workgroup logging is crucial for maintaining operational visibility and troubleshooting capabilities. Without proper logging, organizations cannot effectively monitor query performance, track resource usage, or identify potential issues. Enabled logging supports better operational insights and security monitoring. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| aurora-mysql-cluster-audit-logging | CC7.2 | Audit logging is essential for maintaining database security and regulatory compliance by providing detailed records of all database activities, including user connections, queries, and administrative actions. This capability enables security teams to detect unauthorized access attempts, investigate potential security incidents, and meet compliance requirements for data governance. Without audit logging, organizations lack visibility into database operations and cannot effectively monitor for suspicious activities or demonstrate compliance with regulatory frameworks that require | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | comprehensive audit trails. | |
| aurora-resources-in-logically-air-gapped-vault | CC6.1 | Logical air-gapping is essential for protecting critical database systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical database resources. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| autoscaling-group-elb-healthcheck-required | A1.2 | Health checks for Auto Scaling groups associated with ELBs add a layer of redundancy ensuring the availability of a system or application served from the Auto Scaling group. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| autoscaling-launch-config-public-ip-disabled | CC6.1 | By disabling public IP assignment, the attack surface for EC2 instances launched via ASGs, the attack surface is reduced by prohibiting direct internet access. Instead, place EC2 instances in private VPC subnets and enforce access through the associated load balancer. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| autoscaling-launch-template | CC6.1 | Using a launch template to create an Auto Scaling group ensures access to the latest features and improvements. | Available in all commercial Regions except Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| backup-plan-min-frequency-and-min-retention-check | A1.2, P4.2 | Data loss can occur if recovery points expire before a defined retention period. By configuring the frequency of backup and retention period of the recovery points stored within AWS Backup backups continue to occur based on the retention requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| backup-recovery-point-encrypted | CC6.1 | Encrypting data at rest protects the confidentiality and integrity of your data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-enabled | A1.1, A1.2 | Enabled Batch compute environments are essential for maintaining operational continuity and ensuring that batch processing workloads can execute as expected. Disabled compute environments prevent job queues from launching instances and processing jobs, which can lead to application failures, delayed data processing, and potential business impact. Monitoring the enabled state helps detect unintended configuration changes that could disrupt critical batch processing operations and ensures that compute resources remain available for scheduled and on-demand workloads. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| batch-compute-environment-managed | CC8.1 | Managed compute environments provide significant operational and security advantages by allowing AWS to automatically handle infrastructure provisioning, scaling, and maintenance tasks. This reduces the operational overhead of managing compute resources manually, ensures consistent application of security patches and updates, and provides better integration with AWS services for monitoring and logging. Managed environments also help maintain compliance with organizational standards by leveraging AWS-managed configurations and reducing the risk of misconfigurations that could lead to security | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | vulnerabilities or operational issues. | |
| cloudfront-custom-ssl-certificate | CC6.7 | Only encrypted connections over HTTPS (TLS) should be allowed using custom SSL/TLS certificates, to prevent potential attackers from man-in-the-middle (MitM) or similar attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-no-deprecated-ssl-protocols | CC6.1 | In 2015, the Internet Engineering Task Force (IETF) officially announced that SSL 3.0 should be deprecated due to the protocol being insufficiently secure. Additionally, in 2020, the IETF officially deprecated the TLS 1.0 and TLS 1.1 due to the discovery of security risks after several attacks placing encrypted internet communications at risk. The IETF recommends the use of the two latest versions of the TLS standard - namely TLS 1.2 and TLS 1.3, both deemed secure. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-origin-lambda-url-oac-enabled | CC6.1, CC6.6 | Origin Access Control (OAC) provides enhanced security for CloudFront distributions by ensuring that Lambda Function URLs can only be accessed through CloudFront and not directly by end users. This prevents unauthorized direct access to Lambda functions, reduces exposure to potential attacks, and ensures that all traffic flows through CloudFront's security features including AWS WAF protections, geographic restrictions, and access logging. OAC also helps maintain proper access controls and supports compliance requirements by providing a centralized point of control for function access. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudfront-traffic-to-origin-encrypted | CC6.7 | Encrypting traffic between CloudFron t distribution and its custom origin will ensure that the environme nt is meeting strict compliance requirements and that the traffic is secure. Ensuring data in motion is encrypted will reduce the impact of a security incident or data breach. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |
| cloudfront-viewer-policy-https | CC6.7 | If CloudFront communications do not enforce HTTPS only, then users can use HTTP protocol, which is insecure, leading to potential man-in-the-middle attacks. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-read-s3-data-event-check | CC7.1, CC7.2 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for read data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | if you configure a multi-Region trail that logs read-only or all types of data events for all S3 buckets. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-all-write-s3-data-event-check | CC7.1, CC7.2 | S3 object-level operations, such as GetObject, DeleteObject, and PutObject, are called data events. By default, CloudTrail doesnt log data events, but you can configure trails to log data events for S3 buckets. When you enable object-level logging for write data events, you can log each individual object (file) access within an S3 bucket. Enabling object-level logging can help you meet data compliance requirements, perform comprehensive security analysis, monitor specific patterns of user behavior in your AWS account, and take action on object-level API activity within your S3 buckets by using Amazon CloudWatch Events. This control produces a PASSED finding | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | if you configure a multi-Region trail that logs write-only or all types of data events for all S3 buckets. | |
| cloudtrail-s3-bucket-access-logging | CC7.2 | S3 server access logging is crucial for maintaining security visibility and compliance for audit logs. Without this additional logging layer, organizations may miss unauthorized access attempts to their CloudTrail logs. Complete access logging supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-s3-bucket-public-access-prohibited | CC6.1 | Protecting CloudTrail logs from public access is essential for maintaining the security of audit data. Public exposure of audit logs could reveal sensitive information about your infrastructure and operations. Implementing strict access controls prevents unauthorized access to critical security information. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| cloudtrail-security-trail-enabled | PI1.2 | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-alarm-action-check | CC7.1, CC7.2 | Security groups act as a firewall and controls the inbound and outbound traffic for the resources that it is associated with. They are normally created during the initial stages of the infrastructure setup. Once the infrastructure is finalized, changes to the existing security group setup can indicate a potential malicious activity. Therefore the change action needs to be alerted to the customer and reconciled against the change management system of record. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudwatch-metric-stream-tagged | CC2.1, CC6.1 | Proper tagging of CloudWatch metric streams enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource usage patterns and struggle to implement effective cost controls and access management policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloudtrail-enabled | PI1.2 | Without enabling AWS CloudTrail trail logs and storing them into S3 buckets, organizations run the risk of not having sufficient log history since the default AWS CloudTrail event history is saved for the past 90 days only. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cloud-trail-encryption-enabled | CC6.1 | Encrypting CloudTrail logs at rest is essential to safeguard sensitive information and maintain data privacy. By employing encryption, organizations can thwart unauthorized access to log files, ensuring that even if the underlying storage is compromised, the data remains unreadable. This practice aligns with security best practices, compliance requirements, and helps to build trust with customers by demonstrating a commitment to protecting their valuable data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| cloud-trail-log-file-validation-enabled | PI1.5 | Enabling log file validation ensures the integrity of CloudTrail log files by digitally signing log files using cryptographic hash functions verifying log data has not been tampered with or modified providing a mechanism to investigate the event, trace its origin, and understand the impact supportin g effective incident response. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| cmk-backing-key-rotation-enabled | CC6.1 | Rotating KMS keys to reduce the risk of the key being compromis ed and prevent hackers from gaining access to your data and resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-encrypted-at-rest | CC6.1, CC6.7 | Data at rest refers to data thats stored in persistent, non-volatile storage for any duration. Encrypting data at rest helps you protect its confidentiality, which reduces the risk that an unauthorized user can access it. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codebuild-report-group-tagged | CC2.1, CC6.1 | Proper tagging of CodeBuild report groups enables effective resource management, cost allocation, and governance. Tags provide essential metadata for organizing resources, tracking ownership, implementing automated policies, and maintaining compliance with organizational standards. Without consistent tagging, organizations lose visibility into resource utilization and struggle to implement effective cost controls and security policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-auto-rollback-enabled | A1.1, CC8.1 | Auto rollback configuration in CodeDeploy deployment groups provides critical protection against failed deployments by automatically reverting to the previous working version when deployment failures or alarm thresholds are triggered. This capability minimizes application downtime, reduces the impact of problematic deployments, and ensures service availability. Without auto rollback enabled, failed deployments may require manual intervention to restore service, potentially leading to extended outages and degraded user experience. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-deployment-group-outdated-instances-update | CC6.8 | Automatically updating outdated instances during CodeDeploy deployments ensures consistent application versions across all instances in a deployment group. When outdated instances are ignored, they may continue running older versions of applications, creating security vulnerabilities, inconsistent behavior, and potential compliance issues. This control helps maintain deployment consistency, reduces security risks from unpatched applications, and ensures all instances receive the latest updates and security fixes. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| codedeploy-ec2-minimum-healthy-hosts-configured | A1.2 | Maintaining a minimum number of healthy hosts during deployments is critical for application availability. Without this safeguard, deployments could potentially disrupt all instances simultaneously, causing service outages. Configuring minimum healthy hosts helps maintain service continuity during updates. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-identity-pool-unauth-access-check | CC6.1, CC6.2, CC6.3 | Preventing unauthenticated access to Cognito Identity Pools is critical for maintaining security boundaries and implementing proper access controls. Allowing unauthenticated identities can expose AWS resources to unauthorized users, potentially leading to data breaches, resource abuse, or compliance violations. By monitoring and detecting Identity Pools with unauthenticated access enabled, organizations can ensure that all users are properly authenticated before receiving temporary AWS credentials, supporting defense-in-depth security strategies and regulatory compliance requirements. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-advanced-security-enabled | CC6.1 | Advanced security features in Cognito user pools are essential for protectin g against unauthori zed access and potential threats. Without these features, user accounts may be more vulnerable to attacks such as credential stuffing or brute force attempts. Enabling advanced security strengthens overall user authentic ation and access control. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderaba d), Asia Pacific (Melbourne), Canada West (Calgary) , Europe (Spain), Europe (Zurich), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| cognito-user-pool-tagged | CC2.1, CC6.1 | Proper tagging of Cognito user pools enables effective resource managemen t, cost allocatio n, and governanc e oversight. Tags facilitate automated compliance reporting , support billing transparency across business units or projects, and enable consistent applicati on of security policies. Without standardized tagging, organizations lose visibility into resource ownership , struggle with cost optimization, and face challenge s in maintaining regulatory complianc e requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| customerprofiles-object-type-allow-profile-creation | CC2.1 | Enabling profile creation for Customer Profiles object types ensures seamless customer experience and data continuity. When AllowProfileCreation is enabled, the system can automatically create customer profiles during interactions, preventing data loss and ensuring comprehensive customer relationship management. This configuration supports business continuity, improves customer service efficiency, and maintains complete customer interaction history for analytics and personalization purposes. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (London). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| custom-eventbus-policy-attached | CC6.3 | Attaching a resource policy helps control access to custom EventBus resources , enforcing least privilege and reducing the risk of unauthorized access. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-location-object-storage-using-https | CC6.6, CC6.7 | Enforcing HTTPS protocol for DataSync location object storage communications is critical for maintaining data security and confidentiality during transfer operations. HTTPS provides encryption in transit, protecting sensitive data from interception, tampering, and unauthorized access while data moves between AWS DataSync and external object storage systems. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transfer operations. Additionally, using HTTPS ensures data integrity verification | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | and authentication of storage endpoints, preventing man-in-the-middle attacks and ensuring data reaches its intended destination securely. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-task-data-verification-enabled | CC4.1 | Data verification in DataSync tasks is critical for ensuring data integrity during transfer operation s. When enabled, DataSync performs additional checksums and validation to verify that data has been accuratel y transferred from source to destinati on. This helps detect potential data corruption, incomplete transfers , or transmission errors that could compromise data quality. Without verification, organizat ions may unknowing ly have corrupted or incomplete data in their destination systems, which could lead to application failures, data loss, or compliance violation s in regulated environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| datasync-task-logging-enabled | CC7.2 | Logging DataSync activities is crucial for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor data transfer operations or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dax-tls-endpoint-encryption | CC6.7 | Enabling encryption in transit protects DAX cluster data from unauthorized access during transmission over networks, maintaining data confidentiality. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |
| dms-endpoint-ssl-configured | CC6.7 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dms-endpoint-tagged | CC2.1, CC6.1 | Proper tagging of DMS endpoints is essential for resource management, cost allocation, and operational governance. Tags enable organizations to categorize migration endpoints by project, environment, owner, or business unit, facilitating accurate cost tracking and resource organization. Consistent tagging practices support automated resource management, security policies, and compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership and purpose, making it difficult to manage costs, apply appropriate security controls, and maintain operational | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). | AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| docdb-cluster-encrypted-in-transit | CC6.1, CC6.7 | Encryption in transit protects sensitive data as it moves between DocumentDB clients and clusters, preventing unauthorized interception and eavesdropping on database communications. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2, while reducing the risk of data breaches during transmission. Enabling TLS encryption ensures that database credentials, queries, and results remain confidential and maintain integrity during network transmission. | Available in all commercial Regions except US West (N. California), Africa (Cape Town), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Canada West (Calgary), Europe (Spain), Europe (Stockholm), Europe (Zurich), and Middle East (Bahrain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| dynamodb-table-encrypted-kms | CC6.1 | Encryption of data at rest in DynamoDB is enabled by default. Using AWS KMS reduces the operational complexity of managing encryption keys by integrating transparently with DynamoDB. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| dynamodb-table-encryption-enabled | CC6.1 | Provide data security and privacy by ensuring encryption is enabled for your DynamoDB tables. | Available in all commercial Regions except Asia Pacific (New Zealand). Available in the AWS GovCloud (US) Regions. |
| ebs-resources-in-logically-air-gapped-vault | CC6.6 | Logical air-gapping is essential for protecting critical storage systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical EBS volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ebs-snapshot-public-restorable-check | CC6.1 | Public EBS snapshots can be accessible to other AWS accounts. EBS snapshots should not be restorable by everyone unless it is explicitly allowed, to avoid accidental exposure of data. | Available in all commercial Regions except Europe (Spain). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-capacity-reservation-tagged | CC2.1, CC6.1 | Proper tagging of EC2 capacity reservations is essential for resource management, cost allocation, and operational governance. Tags enable organizations to track resource ownership, categorize reservations by project or department, implement automated billing and chargeback processes, and maintain compliance with internal policies. Without consistent tagging, capacity reservations become difficult to manage at scale, leading to inefficient resource utilization and challenges in cost optimization and accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-carrier-gateway-tagged | CC2.1, CC6.1 | Proper tagging of EC2 carrier gateways is essential for resource managemen t, cost allocatio n, access control, operational visibilit y. Tags enable organizations to categorize track network infrastru cture component s, implement automated governance policies, maintain complianc e with organizat ional standards. Consistent tagging practices facilitat e resource identific ation, billing attributi on, security policy enforcement across carrier gateway resources that provide connectivity between VPCs carrier networks. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central) , Europe (Frankfur t), Europe (Ireland) , Europe (London), and Europe (Paris). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-client-vpn-endpoint-tagged | CC2.1, CC6.1 | Proper tagging of EC2 Client VPN endpoints enables effective resource management, cost allocation, access control, compliance reporting. Tags provide essential metadata for organizing resources, implementing automated governance policies, tracking resource ownership, maintaining security boundaries. Without consistent tagging, organizations lose visibility into resource utilization struggle to enforce governance policies across their VPN infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-enis-source-destination-check-enabled | CC6.1, CC6.6, CC6.7 | Source/destination check is a critical security feature that ensures network interfaces can only send receive traffic that is specifically destined for or originates from the interface. Disabling this check without proper justification can create security vulnerabilities by allowing traffic forwarding potential network bypasses. Monitoring this setting helps maintain network security boundaries, prevents unauthorized traffic routing, ensures compliance with network security policies. This control is particularly important for maintaining the integrity of network traffic flows preventing potential security misconfigurations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-fleet-tagged | CC2.1, CC6.1 | Proper tagging of EC2 fleets is essential for resource management, cost allocation, security governance, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating accurate cost tracking billing allocation. Consistent tagging practices support automated resource management, security policy enforcement, compliance reporting. Without proper tagging, organizations lose visibility into resource utilization, struggle with cost optimization, face challenges in maintaining security compliance postures across their EC2 fleet infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-instance-launched-with-allowed-ami | CC6.1, CC8.1 | Using approved AMIs ensures EC2 instances are built from standardized, secure, properly configured base images. This control helps maintain consistent security baselines, reduces exposure to vulnerabilities from unvetted images, supports compliance requirements for standardized computing environments, enables organizations to enforce governance policies around approved software configurations security hardening standards. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-launch-template-imdsv2-check | A1.2, CC6.1, CC6.6, CC7.1 | Enforcing IMDSv2 usage is crucial for protecting EC2 instances against potential SSRF attacks and unauthorized access to instance metadata. IMDSv2 provides a more secure method of accessing metadata compared to IMDSv1. Requiring IMDSv2 in launch templates ensures consistent application of this security best practice. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-analysis-tagged | CC2.1, CC6.1 | Proper tagging of Network Insights access scope analyses is essential for resource management, cost allocation, operational governance. Tags enable organizations to categorize track network analysis activities, assign ownership responsibility, implement automated lifecycle management, maintain compliance with internal policies. Without consistent tagging, organizations lose visibility into their network analysis resources, making it difficult to manage costs, enforce governance policies, maintain operational accountability across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-access-scope-tagged | CC2.1, CC6.1 | Proper tagging of Network Insights access scopes enables effective resource management, cost allocation, governance across AWS environments. Tags provide essential metadata for tracking resource ownership, purpose, lifecycle management. Consistent tagging practices support automated operations, security policies, compliance reporting requirements. Without adequate tagging, organizations lose visibility into resource utilization patterns struggle to implement effective cost controls access management policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-network-insights-path-tagged | CC2.1, CC6.1 | Proper tagging of Network Insights paths enables effective resource management, cost allocation, operational governance. Tags facilitate automated resource discovery, support compliance reporting requirements, enable consistent application of organizational policies across network analysis resources. Without standardized tagging, organizations lose visibility into resource ownership, purpose, associated costs, making it difficult to maintain operational control meet regulatory requirements. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-resources-in-logically-air-gapped-vault | CC6.6 | Logical air-gapping is essential for protecting critical compute resources from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive systems. Implementing air-gapping provides an additional security barrier for critical EC2 instances. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-spot-fleet-request-ct-encryption-at-rest | CC6.1, CC6.7 | Enabling encryption at rest for EBS volumes attached to EC2 Spot Fleet instances protects sensitive data from unauthorized access helps meet regulatory compliance requirements. Encryption ensures that data stored on EBS volumes is protected both in transit to the storage backend while at rest, reducing the risk of data exposure in case of unauthorized access to the underlying storage infrastructure. This control is particularly important for Spot Fleet instances as they may be terminated recreated frequently, making consistent encryption enforcement critical for maintaining data security across the fleet lifecycle. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-transit-gateway-multicast-domain-tagged | CC2.1, CC6.1 | Proper tagging of transit gateway multicast domains is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated management workflows compliance reporting. Consistent tagging practices improve security posture by supporting attribute-based access controls help maintain governance standards across distributed network infrastructure. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to manage | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | costs maintain security boundaries. | |
| ec2-vpn-connection-logging-enabled | CC7.2 | VPN connection logging is crucial for maintaining visibilit y and operational monitoring. Without proper logging, organizations cannot effectively track VPN usage, investigate connectivity issues, or detect potential security incidents. Complete logging of both tunnels supports network troubleshooting efforts. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ec2-vpn-connection-tagged | CC2.1, CC6.1 | Proper tagging of VPN connections enables effective resource management, cost allocation, governance oversight. Tags facilitate automated operations, security policies, compliance reporting by providing metadata that identifies resource ownership, purpose, environment, other critical attributes. Consistent tagging practices improve operational visibility support organizational policies for resource lifecycle management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-private-image-scanning-enabled | CC7.1 | Enabling private Amazon Elastic Container Registry (ECR) repository image scanning enhances the security of container images stored in the repository. Image scanning helps identify vulnerabilities, malware, and other security issues in the container images before they are deployed. By enabling image scanning, you can proactively detect and address potential security risks, ensuring that only secure and trusted container images are used in your applications. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecr-repository-tagged | CC2.1, CC6.1 | Proper tagging of ECR repositories is essential for resource management, cost allocation, access control, operational visibility. Tags enable organizations to categorize container repositories by environment, application, team ownership, or compliance requirements. Consistent tagging practices facilitate automated resource management, security policies, cost tracking across containerized applications. Without proper tagging, organizations lose visibility into repository ownership purpose, making it difficult to implement governance policies maintain security standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-awsvpc-networking-enabled | CC6.1 | The awsvpc networking mode provides improved security isolation and network control for containerized applications. Without this mode, containers may have limited network security options and visibility. Implementing awsvpc networking enables better container-level network security and monitoring. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-capacity-provider-tagged | CC2.1, CC6.1 | Proper tagging of ECS capacity providers enables effective resource management, cost allocation, governance across containerized workloads. Tags facilitate automated resource discovery, support compliance reporting requirements, enable granular access control policies. Consistent tagging practices improve operational visibility help organizations track resource ownership, environment classification, billing attribution for their container infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-containers-non privileged | CC6.1 | ECS containers should run as non-privileged to protect data and prevent that elevated privileges on the host container instance (similar to the root user) result in unauthorized or unintended changes. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| ecs-containers-rea donly-access | CC6.1 | This control is necessary to reduce security attack vectors, since the container instance' s filesystem cannot be tampered with or written to unless it has explicit read-write permissions on its filesystem folder and directories. This control also adheres to the principle of least privilege. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ecs-task-definition-network-mode-not-host | CC6.1, CC6.6 | Using host network mode in ECS task definitions creates significant security risks by allowing containers to share the host's network stack directly. This configuration bypasses Docker's network isolation, potentially exposing the host system to network-based attacks allowing containers to access services running on the host. Avoiding host network mode helps maintain proper network segmentat ion, reduces the attack surface, ensures container s operate within isolated network environments as intended by container ization security best practices. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-automatic-backups-enabled | A1.2 | Automated backups are essential for maintaining data resilience and business continuity. Without regular backups, organizations risk permanent data loss in case of accidents or system failures. Enabling automatic backups provides a reliable data recovery mechanism. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-encrypted-check | CC6.1 | Encrypting data at rest on EFS protects data from unauthorized access, reduces the risk of potential data breaches, and meets compliance requirements. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-filesystem-ct-encrypted | CC6.1 | Encryption at rest is crucial for protecting sensitive data stored in EFS file systems. Without encryptio n, data could be vulnerable to unauthorized access if storage systems are compromised. Implementing KMS-based encryption provides strong data protection. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| efs-file-system-tagged | CC2.1, CC6.1 | Proper tagging of EFS file systems is essential for resource management, cost allocation, access control, compliance reporting. Tags enable organizations to categorize resources by purpose, owner, environment, or project, facilitating automated governance policies cost tracking. Consistent tagging practices improve operational visibility support security frameworks that rely on resource classification for appropriate access controls monitoring. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| efs-mount-target-public-accessible | CC6.1, CC6.6 | Preventing public access to EFS mount targets is essential for maintaining data security. Public accessibility could expose sensitive file systems to unauthorized access from the internet. Restricting mount targets to private subnets helps protect against unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| efs-resources-in-logically-air-gapped-vault | CC6.1 | Logical air-gapping is critical for protecting sensitive file systems from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive data. Implementing air-gapping provides an additional security barrier for critical file systems. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-addon-tagged | CC2.1, CC6.1 | Proper tagging of EKS add-ons is essential for resource management, cost allocation, operational visibility. Tags enable organizations to categorize track add-ons by environment, owner, project, or cost center, facilitating accurate billing resource governance. Consistent tagging practices support automated management workflows, security policies, compliance reporting. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control over their Kubernetes infrastructure components. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-log-enabled | CC7.2 | Logging is essential for maintaining operational visibility and security monitoring in Kubernetes clusters. Without proper logging, organizations cannot effectively track cluster activities or investigate security incidents. Enabled logging supports better operational insights and security analysis. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| eks-cluster-secrets-encrypted | CC6.1 | When you encrypt secrets, you can use AWS Key Managemen t Service (AWS KMS) keys to provide envelope encryptio n of Kubernetes secrets stored in etcd for your cluster. This encryption is in addition to the EBS volume encryption that is enabled by default for all data (including secrets) that is stored in etcd as part of an EKS cluster. Using secrets encryptio n for your EKS cluster allows you to deploy a defense in depth strategy for Kubernetes applicati ons by encrypting Kubernetes secrets with a KMS key that you define and manage. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-automatic-backup-check-enabled | A1.2 | Automatic backups for ElastiCache clusters are essential for data protection disaster recovery. Regular snapshots ensure that cached data can be restored in case of cluster failures, accidental deletions, or corruption. This control helps maintain business continuity by ensuring that critical cached data is regularly backed up can be recovered within acceptable timeframes, reducing the risk of data loss minimizing downtime during incident recovery. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-rbac-auth-enabled | CC6.3 | RBAC authentication provides fine-grained access control for Redis clusters. Without RBAC, managing access to cache resources could be less secure and more difficult to maintain. Implementing RBAC ensures proper authentication and authorization for cache access. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elasticache-repl-grp-encrypted-in-transit | CC6.7 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic, and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (Thailand ), Canada West (Calgary), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| elasticsearch-node-to-node-encryption-check | CC6.7 | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthori zed modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elastic-beanstalk-logs-to-cloudwatch | CC7.2 | Enhanced health reporting in Elastic Beanstalk provides deeper visibility into application health status beyond basic instance health checks. This capability monitors additional metrics including CPU utilization, application latency, and request rates, enabling more effective troubleshooting and faster incident response. Without enhanced health reporting, organizations may experience delayed detection of performance degradation, potentially resulting in extended service disruptions and negative impact on application availability. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elbv2-listener-encryption-in-transit | CC6.1, CC6.7 | Encrypting data in transit protects sensitive information from interception, eavesdropping, and man-in-the-middle attacks as it travels between clients and load balancers. HTTPS and TLS encryption ensure data confidentiality and integrity, help organizations meet compliance requirements for data protection standards, and demonstrate adherence to security best practices for web applications and services. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| elbv2-multiple-az | A1.2 | By distributing traffic to registere d instances in multiple availabil ity zones (AZs) the ELB provides high availability, automatic scaling, and robust security that improves fault-tolerance for cloud resources. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |
| elb-acm-certificate-required | CC6.7 | Encrypt data in transit to maintain the confidentiality and integrity of data as it traverses public and unsecured networks and reduce the risk of unauthori zed access to data. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (New Zealand), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Israel (Tel Aviv). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-cross-zone-load-balancing-enabled | A1.1, A1.2 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-internal-scheme-check | CC6.1, CC6.6 | Internal load balancer schemes provide an additional layer of network security by restricting access to applications and services from within the VPC only, preventin g direct internet exposure. This configuration helps reduce the attack surface, supports network segmentat ion strategies, and ensures that sensitive internal applications are not inadvertently exposed to external traffic. Monitorin g load balancer schemes helps maintain proper network boundarie s and supports compliance with security frameworks that require internal service isolation. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tagged | CC2.1, CC6.1 | Proper tagging of Classic Load Balancers enables effective resource management, cost allocation, and governance. Tags provide essential metadata for identifying resource ownership, environment classification, cost center attribution, and compliance tracking. Consistent tagging practices facilitate automated resource management, security policy enforcement, and operational visibility across the infrastructure. This control helps ensure organizational tagging standards are maintained and supports audit requirements for resource accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| elb-tls-https-listeners-only | CC6.7 | Custom TLS policies for listeners on AWS Load Balancers help you be compatible, or disable certain TLS protocol versions to meet your organization's security compliance standards and manage connections between the client and the load balancer effectively. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| emr-master-no-public-ip | CC6.1 | Disallowing public IP addresses for cluster master nodes isolates the cluster from the public internet which reduces the attack surface and minimizes the risk of unauthorized access. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-rest | CC6.1, CC6.7 | Encryption at rest for Amazon EMR clusters protects sensitive data stored on cluster instances from unauthorized access. This control helps ensure compliance with data protection regulations and security best practices by detecting EMR configurations that lack proper encryption settings. Monitoring encryption configuration helps prevent data exposure risks and maintains data confidentiality for big data processing workloads. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| emr-security-configuration-encryption-transit | CC6.1, CC6.7 | Encryption in transit protects sensitive data from interception and unauthorized access while it moves between EMR cluster components, including communications between nodes, client connections, and data transfers. Without encryption in transit, data transmitted across networks remains in plaintext and can be compromised through network sniffing, man-in-the-middle attacks, or other network-based security threats. This control helps organizations maintain data confidentiality, meet regulatory compliance requirements such as HIPAA, PCI DSS, and SOX, and implement defense-in-depth security strategies for big | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data processing workloads. | |
| encrypted-volumes | CC6.1 | Encrypting data at rest on EBS volumes facilitates protectio n of data from unauthorized access and rendering the data unreadable and unusable to an unauthorized actor. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| evidently-launch-t agged | CC2.1 | Tagging Evidently launches is crucial for maintaining operational visibilit y and resource management. Proper tagging enables effective resource tracking, cost allocation, and access control. Without structured tagging, organizations may struggle to manage and monitor their feature launches effectively. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| evidently-project-tagged | CC2.1 | Proper tagging of Evidently projects is essential for maintaining project organization and visibility. Tags enable effective resource management, cost tracking, and access control. Without structured tagging, organizations risk losing oversight of their experimentation projects. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-log-configuration-exists | CC7.2 | Experiment logging is essential for maintaining visibility into chaos engineering activities fault injection experiments. Proper logging enables security teams to monitor experiment execution, track changes to infrastructure during testing, maintain audit trails for compliance purposes. Without logging configuration, organizations lose critical visibility into potentially disruptive testing activities, making it difficult to correlate system behavior changes with experiment actions hindering incident response forensic analysis capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fis-experiment-template-tagged | CC2.1, CC6.1 | Proper tagging of FIS experiment templates enables effective resource management, cost allocation, governance oversight of chaos engineering activities. Tags facilitate tracking experiment ownership, categorizing test scenarios by environment or application, implementing automated policies for experiment lifecycle management. Consistent tagging practices also support compliance requirements help organizations maintain visibility into their fault injection testing activities across different teams projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-last-backup-recovery-point-created | CC7.5 | Regular recovery point creation is essential for maintaining data resilience and enabling quick recovery in case of data loss or corruption. Without recent recovery points, organizations risk extended downtime or permanent data loss. Implementing regular backups provides a reliable mechanism for data protection and business continuity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-lustre-copy-tags-to-backups | CC2.1, CC6.1 | Identification and inventory of your IT assets is an important aspect of governance and security. Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type because you can quickly identify a specific resource based on the tags that you assigned to it. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| fsx-windows-audit-log-configured | CC7.2 | File access auditing is crucial for maintaining security visibility and compliance in file storage environments. Without proper auditing, organizations cannot track who accessed sensitive files or detect potential security incidents. Enabling file access auditing supports security monitoring and forensic investigations. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-listener-tagged | CC2.1, CC6.1 | Proper tagging of Gateway Load Balancer listeners enables effective resource management, cost allocation, operational governance. Tags provide essential metadata for tracking resource ownership, environment classification, billing attribution, automated management processes. Consistent tagging practices improve visibility into network infrastructure components, facilitate compliance reporting, support security policies that rely on resource categorization. Without proper tagging, organizations lose critical context for managing load balancer resources may face challenges in cost optimization operational oversight. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glb-tagged | CC2.1, CC6.1 | Proper tagging of Gateway Load Balancers enables effective resource management, cost allocation, governance. Tags facilitate automated operations, help track resource ownership purpose, support compliance reporting, enable consistent application of security policies. Without adequate tagging, organizations lose visibility into resource utilization, struggle with cost management, may fail to meet regulatory requirements for asset tracking accountability. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| glue-job-logging-enabled | CC7.2 | Logging Glue job activities is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor ETL processes or investigate potential issues. Enabled logging supports better operational insights and facilitates troubleshooting of data processing workflows. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| glue-ml-transform-encrypted-at-rest | CC6.1 | Encryption at rest is crucial for protecting sensitive ML data and models from unauthorized access. Without encryption, ML-related data could be vulnerable if storage systems are compromised. Implementing encryption adds an essential layer of security for machine learning assets. | Available in all commercial Regions. Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ec2-protection-runtime-enabled | CC7.2 | GuardDuty Runtime Monitoring observes and analyzes operating system-level, networking, and file events to help you detect potential threats in specific AWS workloads in your environment. It uses GuardDuty security agents that add visibility into runtime behavior, such as file access, process execution, command line arguments, and network connections. You can enable and manage the security agent for each type of resource that you want to monitor for potential threats. This includes Amazon EC2 instances. | Available in all commercial Regions except Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-ecs-protection-runtime-enabled | CC7.2 | Enabling ECS Runtime Monitoring with automated agent management in GuardDuty provides continuous threat detection security monitoring for containerized workloads running on Amazon ECS. This capability detects malicious activities, suspicious network communications, potential security threats within ECS tasks containers at runtime. Automated agent management ensures consistent deployment maintenance of monitoring agents across ECS infrastructure without manual intervention, reducing the risk of security gaps improving operational efficiency. This monitoring is essential for maintaining security | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | visibility in containerized environments meeting compliance requirements for runtime threat detection. | |
| guardduty-eks-protection-audit-enabled | CC7.1, CC7.2 | GuardDuty EKS Audit Log Monitoring analyzes Kubernetes audit logs to detect suspicious or malicious activity in your Amazon EKS clusters, such as unauthorized API calls, privilege escalation, and configuration tampering. Enabling it provides continuous threat detection for the container control plane so that compromises can be identified and investigated quickly. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-eks-protection-runtime-enabled | CC7.1, CC7.2 | EKS Protection in Amazon GuardDuty provides threat detection coverage to help you protect Amazon EKS clusters within your AWS environment. EKS Runtime Monitoring uses operating system-level events to help you detect potential threats in EKS nodes and containers within your EKS clusters. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-enabled-centralized | CC6.8, CC7.2 | Enabling GuardDuty provides a proactive approach to threat detection and response, helping to identify and respond to potential security threats before they can cause significant harm. By implementing GuardDuty for all regions in all accounts, organizations can better protect their AWS environment and reduce the risk of a security breach. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-lambda-protection-enabled | CC7.1, CC7.2 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the Lambda Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Lambda Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-malware-protection-enabled | CC6.8, CC7.1, CC7.2 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administr ator can enable or disable the Malware Protection feature for the member accounts in the organizat ion. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty Malware Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-rds-protection-enabled | CC7.1, CC7.2 | In a multi-account environment, the control generates findings in only the delegated GuardDuty administrator account. Only the delegated administrator can enable or disable the RDS Protection feature for the member accounts in the organization. GuardDuty member accounts cant modify this configuration from their accounts. This control generates FAILED findings if the delegated GuardDuty administrator has a suspended member account that doesnt have GuardDuty RDS Protection enabled. To receive a PASSED finding, the delegated administrator must disassociate these suspended accounts in GuardDuty. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-runtime-monitoring-enabled | CC7.2 | Runtime Monitoring in Amazon GuardDuty provides enhanced threat detection capabilities by analyzing runtime behavior patterns identifying malicious activities that may not be detected through traditional monitoring methods. Enabling this feature strengthens your security posture by providing real-time visibility into potential threats, improving incident response times, helping meet compliance requirements for continuous security monitoring. Without Runtime Monitoring enabled, organizations may miss critical security events face increased exposure to advanced persistent threats runtime-based attacks. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| guardduty-s3-protection-enabled | CC7.2 | S3 Protection is essential for maintaining security visibility over storage resources. Without this feature, organizations may miss potential security threats targeting their S3 buckets. Enabling S3 Protection enhances threat detection capabilities for storage environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| iam-external-access-analyzer-enabled | CC6.6 | Enabling an IAM Access Analyzer external access analyzer continuously identifies resources that are shared with external principals, such as other accounts, federated users, or the public. This helps you detect and remediate unintended external access, enforcing least privilege and reducing the risk of data exposure. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-oidc-provider-tagged | CC2.1, CC6.1 | Tagging IAM OIDC identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated security policies, ensure proper access controls, maintain compliance with organizational standards. Consistent tagging practices also facilitate resource discovery, ownership identification, lifecycle managemen t of identity federatio n components. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-blacklisted-check | CC6.3 | The AWSCloudShellFullAccess managed policy grants broad permissions, including unrestricted file upload and download through AWS CloudShell, which can be used to exfiltrate data or introduce files into the environment. Attaching this policy violates least-privilege principles; grant only the specific CloudShell permissions required so the risk of data exfiltration and misuse is minimized. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-admin-access | CC6.1 | To ensure the confidentiality, integrity and availability of AWS resources from accidental or malicious activity, IAM policies containing full administrative privileges must not be permitted. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-policy-no-statements-with-full-access | CC6.1 | Restricting policy statements from allowing all actions on resources in AWS IAM is a critical control that enforces the principle of least privilege, strengthens access controls, mitigates risks, ensures compliance, and enhances auditing and accountability. It helps organizations maintain a secure and well-governed AWS environment by granting only the necessary permissions to IAM entities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-saml-provider-tagged | CC2.1, CC6.1 | Proper tagging of IAM SAML identity providers is essential for resource management, cost allocation, security governance. Tags enable organizat ions to categoriz e track identity providers, implement automated policies, maintain complianc e with internal governance standards . Untagged SAML providers can lead to difficulties in resource identification, cost tracking, may indicate resources that were created outside of establish ed provisioning processes. This control helps ensure consistent applicati on of organizational tagging strategie s across identity access management resources. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iam-server-certificate-tagged | CC2.1, CC6.1 | Tagging IAM server certificates is essential for effective resource management, cost allocation, security governance. Tags enable organizations to categorize certificates by environment, application, owner, or purpose, facilitating easier identification management of SSL/TLS certificates. Proper tagging supports compliance requirements, enables automated certificate lifecycle management, helps track certificate usage across different applications, ensures accountability for certificate ownership. Without consistent tagging, organizations may struggle to maintain visibility into their certificate inventory, leading to potential security | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | risks from expired or unused certificates. | |
| iam-user-mfa-enabled | CC6.1, CC6.6 | MFA adds an extra layer of security to user authentication by requiring users to provide a second form of authentication, such as a security token. This helps protect resources from unauthorized access, meets compliance requirements, and enhances the security of your overall environment. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| restricted-ssh | CC6.6 | It is recommended that no security group allows unrestricted ingress access to secure remote access services. Traffic should be scoped to a narrow range of IP addresses required for specific business needs to reduce risk of exposure. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ec2-scan-enabled | CC7.1 | Amazon Inspector EC2 scanning extracts metadata from your Amazon Elastic Compute Cloud (Amazon EC2) instance, and then compares this metadata against rules collected from security advisories to produce findings. Amazon Inspector scans instances for package vulnerabilities and network reachability issues. For information about supported operating systems, including which operating system can be scanned without an SSM agent, see Supported operating systems: Amazon EC2 scanning. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-ecr-scan-enabled | CC7.1 | Container image scanning is essential for maintaining security in containerized environments. Without regular scanning, organizations may deploy containers with known vulnerabilities. Implementing automated ECR scanning helps ensure container image security. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |
| inspector-lambda-code-scan-enabled | CC7.1 | Lambda code scanning is crucial for maintaining security in serverless architectures. Without code scanning, organizations may deploy functions with security weaknesses. Implementing automated code scanning helps identify and address potential vulnerabilities in Lambda functions. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), Europe (Ireland), Europe (London), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| inspector-lambda-standard-scan-enabled | CC7.1 | Enabling Amazon Inspector Lambda standard scanning continuously assesses Lambda functions for known vulnerabilities in their package dependencies. This provides early detection of exploitable CVEs so they can be remediated before they are abused, strengthening the security posture of serverless workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Canada West (Calgary), Europe (Spain), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotdevicedefender-custom-metric-tagged | CC2.1, CC6.1 | Proper tagging of IoT Device Defender custom metrics enables effective resource management, cost allocation, and governance across IoT monitoring infrastructure. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, environment classification, and billing attribution for their IoT security monitoring capabilities. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Hong Kong), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-asset-model-tagged | CC6.1 | Proper tagging of IoT asset models is crucial for maintaining operational visibility and control. Without structured tagging, organizations may struggle to manage and track their industrial asset configurations effectively. Tags enable efficient resource management and access control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-dashboard-tagged | CC6.1 | Proper tagging IoT dashboards is essential for maintaining clear visibility and control over industrial monitoring interfaces. Proper tagging enables efficient resource management and access control. Without structured tagging, organizations risk losing oversight of their visualization resources. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-gateway-tagged | CC6.1 | Proper tagging IoT gateways is crucial for maintaining operational control and visibility of industrial edge devices. Without proper tagging, organizations may face challenges in managing their IoT gateway infrastru cture. Implementing structured tagging supports efficient device management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |
| iotsitewise-portal-tagged | CC6.1 | Proper tagging IoT portals is essential for maintaining visibility and control over industrial web interfaces. Without structured tagging, organizations may struggle to manage access and resources effectively. Proper tagging facilitat es efficient portal management and security control. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland) . Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iotsitewise-project-tagged | CC6.1 | Proper tagging IoT projects is crucial for maintaining clear visibility and control over industrial IoT initiatives. Without proper tagging, organizations may lose track of project resources and responsibilities. Implementing structured tagging supports efficient project management and goverce. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iottwinmaker-component-type-tagged | CC2.1, CC6.1 | Proper tagging of IoT TwinMaker component types enables effective resource management, cost allocation, and governance across digital twin implementations. Tags facilitate automated resource discovery, support compliance reporting requirements, and enable granular access control policies. Consistent tagging practices improve operational visibility and help organizations track resource ownership, project attribution, and lifecycle management of their digital twin components. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-authorizer-token-signing-enabled | CC6.6 | Enabling token signing requirements for IoT authorizers is critical for maintaining secure authentication and authorization in IoT environments. Token signing provides cryptographic assurance that authorization tokens have not been tampered with and originate from trusted sources. Without proper token signature validation, unauthorized devices or malicious actors could potentially forge or manipulate tokens to gain unauthorized access to IoT resources and data. This control helps ensure the integrity of the authorization process and prevents token-based attacks in IoT deployments. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| iot-job-template-tagged | CC2.1, CC6.1 | Tagging IoT job templates is essential for maintaining proper resource governance, enabling accurate cost tracking and allocation, and supporting automated resource management workflows. Tags facilitate resource organization, access control policies, and compliance reporting. Without proper tagging, organizations lose visibility into resource ownership, struggle with cost optimization, and face challenges in implementing consistent security and operational policies across their IoT infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ivs-channel-playback-authorization-enabled | CC6.2, CC6.3 | Enabling playback authorization on IVS channels provides essential access control mechanisms for video streaming content. This control helps prevent unauthorized viewing of video streams, protects sensitive or premium content from being accessed without proper authentication, and ensures compliance with content distribution policies. Playback authorization allows organizations to implement viewer authentication, token-based access control, and content protection strategies that are critical for maintaining the security and integrity of video streaming services. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Tokyo), Europe (Frankfurt), and Europe (Ireland). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kinesis-firehose-delivery-stream-encrypted | CC6.1, CC6.7 | Encryption of streaming data is essential for maintaining data security and compliance. Without encryption, sensitive data could be vulnerable to unauthorized access. Implementing server-side encryption provides crucial protection for streaming data at rest. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| kinesis-stream-backup-retention-check | C1.1 | Proper data retention configuration is crucial for ensuring data availability for downstream processing. Without adequate retention settings, organizations risk losing access to important streaming data. Implementing appropriate retention periods supports data processing requirements and compliance needs. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-cmk-not-scheduled-for-deletion | CC6.1 | KMS keys cannot be recovered if deleted and any data which has been encrypted by that KMS key will be unrecoverable leading to business loss of data. If meaningful data has been encrypted under a KMS key scheduled for deletion, consider decrypting the data or re-encrypting the data under a new KMS key unless you are intentionally performing a cryptographic erasure. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), and Europe (Milan). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-policy-no-public-access | CC6.1 | Restricting public access to KMS keys is essential for maintaining encryption security. Public exposure of encryption keys could compromise data security across multiple services. Implementing strict access controls on KMS keys helps prevent unauthorized key usage. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| kms-key-tagged | CC2.1, CC6.1 | Tagging KMS keys is essential for proper resource management, cost allocation, and security governance. Tags enable organizations to categorize encryption keys by purpose, owner, environment, or compliance requirements, facilitating easier key lifecycle management and access control policies. Proper tagging also supports automated security processes, audit trails, and helps ensure encryption keys can be quickly identified and managed according to organizational policies and regulatory requirements. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lambda-function-xray-enabled | CC7.1, CC7.2 | Enabling AWS X-Ray tracing on Lambda functions provides critical visibility into application performance, request flows, and potential bottlenecks in serverless architectures. X-Ray tracing enables developers and operations teams to identify performance issues, debug errors, and understand service dependencies across distributed applications. This monitoring capability is essential for maintaining application reliability, optimizing performance, and meeting operational excellence standards in production environments. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-bucket-tagged | CC2.1, CC6.1 | Tagging Lightsail buckets enables proper resource management, cost allocation, and organizational governance. Tags facilitate automated resource discovery, help track ownership and purpose, support billing categorization, and ensure compliance with organizational policies. Without proper tagging, organizations lose visibility into resource utilization and struggle to maintain effective cloud governance practices. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-certificate-tagged | CC2.1, CC6.1 | Tagging Lightsail certificates enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking certificate ownership, purpose, and lifecycle management. Consistent tagging practices improve operational visibility, facilitate automated management tasks, and support compliance requirements by ensuring all SSL/TLS certificates can be properly identified and categorized within the infrastructure. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| lightsail-disk-tagged | CC2.1, CC6.1 | Proper tagging of Lightsail disks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for asset identification. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, and face challenges in implementing automated management workflows. | Available only in US East (N. Virginia), US East (Ohio), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), and Europe (Stockholm). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mfa-enabled-for-iam-console-access | CC6.1, CC6.6 | Enabling MFA adds an additional layer of security for IAM users with Console passwords and protects your AWS services and resources against hacking, enhances user authentication, secures remote working and minimizes password risks such as password cracking, and brute force attacks. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-broker-ldap-authentication | CC6.1 | LDAP authentication provides centralized user management and enhanced security controls for Amazon MQ brokers. Using LDAP enables organizations to leverage existing directory services for consistent authentication policies, supports advanced features like group-based authorization, and provides better audit trails for user access. This approach reduces security risks associated with local user accounts and ensures compliance with enterprise identity management standards. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-active-single-instance-broker-storage-type-efs | A1.2 | Using EFS storage type for Amazon MQ ActiveMQ single-instance brokers provides enhanced durability, availability, and performance characteristics compared to other storage options. EFS offers automatic scaling, built-in redundancy across multiple Availability Zones, and better integration with AWS backup and recovery services. This storage configuration helps ensure message persistence, reduces the risk of data loss during broker failures, and supports better disaster recovery capabilities for messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-automatic-minor-version-upgrade-enabled | CC8.1 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-auto-minor-version-upgrade-enabled | CC8.1 | Automatic minor version upgrades are crucial for maintaining broker security and stability. Without automated updates, brokers may run outdated software versions with known vulnerabilities. Enabling automatic upgrades helps ensure brokers remain current with security patches. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-broker-general-logging-enabled | CC7.2 | Enabling general logging on Amazon MQ brokers is essential for security monitoring, operational troubleshooting, and compliance requirements. General logs capture important broker activities, connection events, and operational metrics that are crucial for detecting security incidents, diagnosing performance issues, and maintaining audit trails. Without proper logging, organizations lose visibility into message broker operations and may fail to meet regulatory compliance requirements that mandate comprehensive logging of messaging infrastructure. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| mq-no-public-access | CC6.1 | Restricting public access to MQ brokers is essential for maintaining messaging security. Public exposure of message brokers could lead to unauthorized access and data breaches. Implementing private access controls helps protect sensitive messaging infrastructure. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-cluster-public-access-disabled | CC6.1, CC6.6 | Disabling public access on Amazon MSK clusters is critical for maintaining data security and preventing unauthorized access to streaming data. MSK clusters often handle sensitive business data and real-time analytics that should remain within controlled network boundaries. Enabling public access exposes clusters to potential security threats from the internet, including data breaches, unauthorized data consumption, and malicious attacks. Restricting access to private networks ensures that only authorized applications and users within your VPC can connect to the MSK cluster, supporting defense-in-depth security | Available in all commercial Regions except Asia Pacific (Malaysia), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | strategies and compliance with data protection regulatio ns. | |
| msk-cluster-tagged | CC2.1, CC6.1 | Proper tagging of MSK clusters is essential for resource managemen t, cost allocatio n, access control, and operational visibility. Tags enable organizations to categorize resources by environment, owner, project, or cost center, facilitat ing automated governance policies and billing analysis. Without consistent tagging, organizat ions lose visibilit y into resource ownership and usage patterns, making it difficult to implement effective security policies, track costs, and maintain complianc e with organizational standards. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-connect-connector-logging-enabled | CC7.2 | Enabling logging for MSK Connect connectors is essential for operational visibility, troubleshooting, and security monitoring. Logs provide critical insights into connector performance, data processing activities, error conditions, and potential security events. Without proper logging, organizations lose the ability to effectively monitor data pipeline operations, diagnose issues, meet compliance requirements for audit trails, and detect suspicious activities or data processing anomalies. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Osaka), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), Mexico (Central), Middle East (Bahrain), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-enhanced-monitoring-enabled | CC7.2 | Enhanced monitoring is crucial for maintaining operational visibility and performance of Kafka clusters. Without detailed monitoring, organizations may miss critical performance issues or capacity problems. Implementing enhanced monitoring supports better cluster management and troubleshooting. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| msk-in-cluster-node-require-tls | CC6.7 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting data in transit also reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| msk-unrestricted-access-check | CC6.1, CC6.3 | Amazon MSK supports client authentication and authorization mechanisms to control access to a cluster. These mechanisms verify the identity of clients connecting to the cluster and determine which actions clients can perform. An MSK cluster can be configured to allow unauthenticated access, which allows any client with network connectivity to publish and subscribe to Kafka topics without providing credentials. Running an MSK cluster without requiring authentication violates the principle of least privilege and can expose the cluster to unauthorized access. It can allow any client to access, modify, or delete | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | data in Kafka topics, potentially resulting in data breaches, unauthorized data modifications, or service disruptio ns. We recommend enabling authentic ation mechanisms such as IAM authentic ation, SASL/SCRA M, or mutual TLS to ensure proper access control and maintain security compliance. | |
| neptune-cluster-en crypted | CC6.1 | Encrypting Amazon Neptune clusters at rest protects the confidentiality and integrity of data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourn e), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary) , Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| neptune-cluster-multi-az-enabled | A1.2 | Multi-AZ configuration is essential for maintaining database availability and data resilience. Without Multi-AZ, Neptune clusters are vulnerable to single points of failure. Implementing Multi-AZ replication enhances database reliability and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Milan), Europe (Spain), Europe (Zurich), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |
| netfw-multi-az-enabled | CC6.6 | By deploying a AWS Network Firewall firewall across multiple AZs, traffic can be balanced and shifted among AZs, which helps in designing highly available solutions. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-policy-rule-group-associated | CC6.6 | Associating network firewall policies with rule groups ensures that consistent and appropriate criteria is used for inspecting and handling stateful and stateless network traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| netfw-stateless-rule-group-not-empty | CC6.6 | A rule group contains rules that define how firewall processes traffic in a VPC. An empty stateless rule group, when present in a firewall policy, might give the impression that the rule group will process traffic. However, when the stateless rule group is empty, it does not process traffic. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| netfw-subnet-change-protection-enabled | CC6.6, CC7.1, CC7.2, CC8.1 | AWS Network Firewall is a stateful, managed network firewall and intrusion detection service that you can use to inspect and filter traffic to, from, or between your Virtual Private Clouds (VPCs). If you enable subnet change protection for a Network Firewall firewall, you can protect the firewall against accidental changes to the firewalls subnet associations. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-cross-zone-load-balancing-enabled | A1.2 | If a Load Balancing resource does not have cross-zon e load balancing enabled, it can then lead to a potential performance impact if the underlying targets are not evenly deployed across AZs. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-internal-scheme-check | CC6.1, CC6.6 | Enforcing internal scheme configuration for Network Load Balancers helps maintain network security boundaries and reduces attack surface by ensuring load balancers are only accessible from within the VPC. This control supports defense-in-depth strategies by preventing unintended internet exposure of internal applications and services. Internal load balancers also help organizations comply with security frameworks that require network segmentation and controlled access to application infrastructure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-listener-tagged | CC2.1 | Proper tagging of Network Load Balancer listeners enables effective resource managemen t, cost allocatio n, and operation al visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, support compliance reporting requirements, and enable efficient filtering and organization of load balancing resources across environments. Consistent tagging practices are essential for maintaining security boundarie s and implementing least-privilege access controls. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| nlb-tagged | CC2.1, CC6.1 | Tagging Network Load Balancers enables proper resource managemen t, cost allocation, and governance. Tags facilitate automated operations, help identify resource ownership and purpose, support compliance reporting , and enable effective cost tracking across different projects, environments, or business units. Consistent tagging practices are essential for maintaining visibility and control over load balancer resources in large-sca le AWS environments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-access-control-enabled | CC6.1 | Enabling fine-grained access controls in Amazon OpenSearch service domains ensures data security, compliance, least privilege, data governance, auditing capabilities, and controlled access, while protecting sensitive data to mitigate risks and maintain data integrity. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-data-node-fault-tolerance | A1.2 | Configuring OpenSearch domains with at least three data nodes and multi-AZ enabled enhances availability, fault tolerance, scalability, performance, data resilience, and disaster recovery capabilities. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-https-required | CC6.7 | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-node-to-node-encryption-check | CC6.7 | Encryption prevents potential attackers from intercepting traffic between OpenSearch nodes preventing unauthorized modifications keeping the cluster secure ensuring data integrity while maintaining accuracy and reliability of stored information. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| opensearch-primary-node-fault-tolerance | A1.2 | Primary node fault tolerance is crucial for maintaining OpenSearch cluster reliability. Without sufficient primary nodes, clusters are at risk of service disruptions during node failures. Implementing a three-node primary configuration provides robust fault tolerance. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-aurora-postgresql-logs-to-cloudwatch | CC7.2 | CloudWatch logging for Aurora PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), and Europe (Spain). Available in the AWS GovCloud (US) Regions. |
| rds-cluster-encrypted-at-rest | CC6.1 | Encrypting data at rest protects the confidentiality and integrity of the data and reduces the risk of unauthorized access to the data. | Available in all commercial Regions except Canada West (Calgary) and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-event-subscription-tagged | CC2.1, CC6.1 | Proper tagging of RDS event subscriptions enables effective resource management, cost allocation, and governance. Tags provide essential metadata for tracking ownership, environment classification, billing attribution, and automated operations. Consistent tagging across all AWS resources, including RDS event subscriptions, supports compliance with organizational policies and facilitates resource discovery and management at scale. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-instance-subnet-igw-check | CC6.1 | RDS instances deployed in public subnets with internet gateway routes create significa nt security risks by potentially exposing database resources directly to the internet. This configuration increases the attack surface and makes databases vulnerabl e to unauthorized access attempts, data breaches, and other security threats. Following the principle of least privilege and defense in depth, RDS instances should be deployed in private subnets and accessed through secure channels such as VPN connectio ns, bastion hosts, or application servers in public subnets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mariadb-instance-encrypted-in-transit | CC6.1, CC6.7 | Enabling encryption in transit for RDS MariaDB instances protects sensitive data as it moves between clients and the database server. Without encryption in transit, database communications are vulnerable to interception, eavesdropping, and man-in-the-middle attacks. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX by ensuring that database connections maintain confidentiality and integrity during transmission. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-mysql-instance-encrypted-in-transit | CC6.1, CC6.7 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-option-group-tagged | CC2.1, CC6.1 | Tagging RDS option groups enables proper resource management, cost allocation, and governance. Tags provide essential metadata for tracking resource ownership, environment classification, and automated management processes. Consistent tagging practices improve operational visibility, support compliance reporting requirements, and facilitate effective resource lifecycle management across RDS deployments. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-postgresql-logs-to-cloudwatch | CC7.2 | CloudWatch logging for RDS PostgreSQL is essential for maintaining operational visibility and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitates auditing. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| rds-postgres-instance-encrypted-in-transit | CC6.1, CC6.7 | Encryption in transit is crucial for protecting data as it moves between the database and clients. Without proper encryption, sensitive information could be exposed to man-in-the-middle attacks. Implementing transit encryption safeguards data confidentiality and integrity. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-proxy-tls-encryption | CC6.1, CC6.7 | Enforcing TLS encryption on RDS proxy connections protects sensitive database traffic from interception and eavesdropping attacks. TLS encryption ensures data confidentiality and integrity during transmission between applications and databases, helping organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOC 2. Additionally, encrypted connections prevent credential theft and man-in-the-middle attacks that could compromise database security. | Available in all commercial Regions except Asia Pacific (Taipei). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sqlserver-encrypted-in-transit | CC6.1, CC6.7 | Encrypting data in transit protects sensitive information from interception and unauthorized access as it travels between clients and RDS SQL Server instances. Without encryption in transit, database communications are vulnerable to man-in-the-middle attacks, eavesdropping, and data breaches. Implementing encryption in transit helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while ensuring confidentiality and integrity of database communications across network connections. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| rds-sql-server-logs-to-cloudwatch | CC7.2 | CloudWatch logging for RDS SQL Server is essential for maintaining operational visibilit y and security compliance. Without proper logging, organizations cannot effectively monitor database activities or investigate security incidents. Enabled logging supports better operational insights and facilitat es auditing. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-multi-az-enabled | A1.2 | Multi-Availability Zone deployment for Amazon Redshift clusters provides enhanced availability and fault tolerance by maintaining a standby cluster in a separate Availability Zone. This configuration ensures business continuity during infrastructure failures, planned maintenance activities, or Availability Zone outages. Multi-AZ deployments reduce the risk of data warehouse downtime and help meet high availability requirements for critical analytics workloads and business intelligence applications. | Available in all commercial Regions except US West (N. California) and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-cluster-subnet-group-multi-az | A1.2, CC9.1 | Configuring a Redshift cluster subnet group with subnets in more than one Availability Zone allows the cluster to be provisioned or recovered across AZs. This improves availability and resilience and reduces the risk that a single AZ disruption makes the data warehouse unavailable. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| redshift-require-tls-ssl | CC6.7 | Encryption in transit can help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. Encrypting traffic to Redshift clusters protects data in transit and reduces the risk of unauthorized access and data loss. | Available in all commercial Regions except Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-publish-logs-to-cloudwatch | CC7.2 | If you configure Amazon Redshift Serverless to export connection log (connectionlog) and user log (userlog) data to a log group in Amazon CloudWatch Logs, you can collect and store your log records in durable storage, which can support security, access, and availability reviews and audits. With CloudWatch Logs, you can also perform real-time analysis of log data and use CloudWatch to create alarms and review metrics. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-encrypted-in-transit | CC6.1, CC6.7 | Enforcing SSL encryption for Amazon Redshift Serverless workgroups protects sensitive data transmitted between clients and the data warehouse from interception and tampering. Unencrypted data in transit is vulnerable to man-in-the-middle attacks and eavesdropping, which could lead to data breaches and compromise data integrity. This control helps organizations meet compliance requirements for data protection standards such as PCI DSS, HIPAA, and SOX, while maintaining the confidentiality and integrity of data warehouse communications. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-no-public-access | CC6.6 | Preventing public access to Redshift Serverless workgroups is critical for maintaining data security and reducing attack surface. Workgroups that allow public access expose sensitive data warehouses to potential unauthorized access from the internet, increasing the risk of data breaches, unauthorized queries, and compliance violations. Restricting access to private networks ensures that data warehouse resources are only accessible through controlled network paths with appropriate security controls. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), and Middle East (Bahrain). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| redshift-serverless-workgroup-routes-within-vpc | CC6.1 | Routing Redshift Serverless workgroup traffic through a VPC provides essential network isolation and security controls. VPC routing enables organizations to implement network-level access controls, monitor traffic patterns, and maintain compliance with security frameworks that require private network configurations. This control helps prevent unauthorized external access to data warehouse resources and ensures that sensitive data processing occurs within a controlled network environment. | Available in all commercial Regions except Africa (Cape Town), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Osaka), Canada West (Calgary), Europe (Milan), Middle East (Bahrain), Middle East (UAE), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| redshift-unrestricted-port-access | CC6.6 | Limiting inbound access to Redshift clusters is essential for maintaining database security. Unrestricted access could lead to unauthorized data access or potential attacks. Implementing strict inbound rules helps protect sensitive data and maintain cluster security. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |
| required-tags | C1.1 | Tags can help you manage, identify, organize, search for, and filter resources. Tagging can also be used to create new resource constructs for visibility or control (such as grouping together resources that make up a micro-service, application, or workload). Tagging is fundamental to providing enterprise-level visibility and control. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-hardware-mfa-enabled | CC6.1 | A hardware MFA device signature adds an extra layer of protection on top of your existing root credentials making your AWS root account virtually impossible to penetrate without the MFA generated passcode. This also lessens the risks of losing access to the virtual MFA due to device loss, device trade-in, or if the individual owning the device is no longer employed at the company. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| root-account-mfa-enabled | CC6.1, CC6.6 | An MFA device signature adds an extra layer of protection on top of your existing root credentials making the AWS root account virtually impossible to penetrate without the unique passcode generated by the MFA device. It also mitigates the risk of unauthorized access in the event of credential exposure. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-health-check-tagged | CC2.1, CC6.1 | Proper tagging of Route 53 health checks enables effective resource management, cost allocation, and operational visibility. Tags facilitate automated governance policies, help track resource ownership and purpose, and support compliance requirements for resource identification and categorization. Without consistent tagging, organizations lose visibility into health check usage patterns and may struggle with cost optimization and resource lifecycle management. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| route53-hosted-zone-tagged | CC2.1, CC6.1 | Proper tagging of Route 53 hosted zones enables effective resource management, cost allocation, and governance. Tags facilitate automated operations, help track resource ownership and purpose, support compliance reporting, and enable consistent application of security policies across DNS infrastructure. Without tags, organizations lose visibility into resource utilization and struggle to maintain proper cost controls and operational oversight of their DNS services. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-access-point-in-vpc-only | CC6.6 | VPC-only access for S3 access points is crucial for maintaining data security and privacy. Internet-accessible access points could lead to unauthorized data exposure. Implementing VPC-only access helps protect sensitive data stored in S3 buckets. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-account-level-public-access-blocks | PI1.5 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-account-level-public-access-blocks-periodic | PI1.5 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-cross-region-replication-enabled | A1.2 | Cross-Region Replication is essential for maintaining data availability and disaster recovery capabilities. Without replication, organizations risk data loss in case of region-wide outages. Implementing Cross-Region Replication enhances data durability and supports business continuity. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-level-public-access-prohibited | PI1.5 | CloudTrail logs include detailed events of API activity in your AWS account. It is a security best practice to tightly control who has access to these logs, and making them publicly accessible could lead to accidental exposure of details about your environment. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-mfa-delete-enabled | PI1.5 | Enabling MFA delete for Amazon S3 buckets ensures that critical objects cannot be deleted without an additional layer of authentication, reducing the risk of accidental or malicious data loss and enhancing overall data protection and security. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-public-read-prohibited | CC6.1, CC6.6, PI1.5 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-public-write-prohibited | CC6.1, CC6.6, PI1.5 | To keep sensitive data protected from unauthorized users, manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed (read). | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-server-side-encryption-enabled | PI1.5 | Ensuring server side encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets reduces the likelihood of unintentional data exposure and reduces your risk of a data breach. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-bucket-ssl-requests-only | CC6.7 | Protect data in transit by using TLS encryption when sending data to S3 buckets. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| s3-bucket-tagged | CC2.1, CC6.1 | Tagging S3 buckets is essential for effective resource management, cost allocation, and governance. Tags enable organizations to categorize buckets by purpose, owner, environment, or project, facilitating accurate cost tracking and billing. Proper tagging also supports automated resource management, security policies, and compliance reporting. Without consistent tagging, organizations lose visibility into resource usage patterns and may struggle to implement effective access controls or lifecycle policies. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-last-backup-recovery-point-created | A1.2 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for S3 data. Without recent recovery points, organizations risk permanent data loss in case of accidental deletions or corruption. Implementing regular backups provides a reliable mechanism for S3 data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| s3-lifecycle-policy-check | C1.1, P4.2, PI1.5 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitate adherence to retention schedules. Retaining objects provide added-security, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-resources-in-logically-air-gapped-vault | CC6.6 | Logical air-gapping is essential for protecting critical S3 data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical S3 bucket data. | Available only in US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| s3-version-lifecycle-policy-check | C1.1, P4.2, PI1.5 | Lifecycle policies allow you to reduce storage costs by automatically moving objects to more cost effective S3 storage tiers, and facilitat e adherence to retention schedules . Retaining objects provide added-sec urity, compliance, corporate record retention, and resiliency. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-in-vpc | CC6.1 | Using customer-owned VPCs for SageMaker domains provides enhanced network security and control by allowing organizations to implement custom network access controls, security groups, and network monitoring. This configuration enables better isolation of machine learning workloads, prevents unauthorized network access, and ensures compliance with organizational network security policies. Additionally, VPC configuration allows for integration with existing network security tools and provides audit trails for network traffic analysis. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-domain-tagged | CC2.1, CC6.1 | Proper tagging of SageMaker domains enables effective resource management, cost allocation, and governance across machine learning workloads. Tags facilitate automated compliance reporting, support billing transparency by enabling cost tracking across projects or departments, and help enforce organizational policies for resource classification. Additionally, consistent tagging practices improve operational efficiency by enabling automated resource discovery and management workflows. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-endpoint-configuration-kms-key-configured | CC6.1 | Enabling encryption with AWS KMS protects data at rest in Amazon SageMaker, making it difficult for unauthorized individuals to access or manipulate the data. AWS KMS provides centralized key management, facilitating the management of keys and their lifecycle. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |
| sagemaker-endpoint-config-prod-instance-count | A1.2 | Production variants running with an instance count greater than 1 permit multi-AZ instance redundancy managed by SageMaker AI. Deploying resources across multiple Availability Zones is an AWS best practice to provide high availability within your architecture. High availability helps you to recover from security incidents. | Available in all commercial Regions except Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-feature-group-tagged | CC2.1, CC6.1 | Tagging SageMaker feature groups is essential for resource management, cost allocation, and governance. Tags enable organizat ions to categorize and track machine learning resources , implement proper access controls, automate operation al tasks, and maintain compliance with organizational policies. Without proper tagging, it becomes difficult to manage costs, enforce security policies, and maintain visibility into ML infrastructure usage across teams and projects. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-in-vpc | CC6.1 | Configuring SageMaker models to use VPC for container traffic provides essential network isolation and security controls for machine learning workloads . VPC configuration enables organizations to control network access, implement security groups and network ACLs, monitor traffic flows, and ensure that model inference and training data remain within controlled network boundarie s. This control helps prevent unauthorized access to sensitive ML models and data, supports complianc e with data privacy regulations, and reduces the attack surface by eliminati ng exposure to public internet traffic. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Malaysia ), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-model-isolation-enabled | CC6.1, CC6.6 | Network isolation for SageMaker models is critical for maintaining data security and preventing unauthorized network access during machine learning operations. When network isolation is enabled, models cannot make outbound network calls, reducing the risk of data exfiltration, unauthorized external communications, and potential security breaches. This control helps organizations maintain compliance with data protection regulations and implement defense-in-depth security strategies for their machine learning workloads. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sagemaker-notebook-instance-kms-key-configured | CC6.1 | Sensitive information can be stored on the storage volumes attached to Amazon SageMaker notebook instance. Amazon KMS key ensures that the data at rest is encrypted. Encryption of data-at-rest is a recommended best practice to add a layer of access management around your data. In case of any compromise to your SageMaker resources, encryption-at-rest ensures that you data is protected from unintended access. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| securityhub-enabled | CC7.2 | AWS Security Hub provides a comprehensive view of your security in AWS and helps you check your environment against security industry standards and best practices, while enabling a quick assessment of the security posture across AWS accounts. In addition, it allows for consolidation and centralization of security findings and data with actionable insights. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-portfolio-tagged | CC2.1, CC6.1 | Proper tagging of Service Catalog portfolios enables effective resource management, cost allocation, and governance oversight. Tags provide essential metadata for tracking ownership, environment classification, cost center attribution, and compliance requirements. Without consistent tagging, organizations lose visibility into resource utilization, struggle with accurate cost reporting, and face challenges in maintaining security and compliance postures across their Service Catalog offerings. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| service-catalog-shared-within-organization | CC6.3 | Portfolio sharing only within Organizations helps ensure that a portfolio isnt shared with incorrect AWS accounts. To share a Service Catalog portfolio with an account in an organization, Security Hub recommends using ORGANIZATIONMEMBER ACCOUNT instead of ACCOUNT. This simplifies administration by governing the access granted to the account across the organization. If you have a business need to share Service Catalog portfolios with an external account, you can automatically suppress the findings from this control or disable it. | Available in all commercial Regions except Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| sns-encrypted-kms | CC6.1 | Encrypting data at rest reduces the risk of data stored on disk being accessed by unauthenticated users. This adds a data protection layer from a threat actor attempting to gain unauthorized access to SNS topic data. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| sns-topic-no-public-access | CC6.1, CC6.3 | Restricting public access to SNS topics is essential for maintaining messaging security and data privacy. Public exposure of SNS topics could lead to unauthori zed data access or potential informati on leaks. Implement ing private access controls helps protect sensitive communica tion channels. | Available in all commercial Regions except Canada West (Calgary). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-dlq-check | A1.1, PI1.3 | Dead letter queues are essential for robust message processing architectures as they provide a mechanism to isolate and examine messages that repeatedly fail processing. Without DLQ configuration, failed messages may be lost permanently or continue consuming processing resources through infinite retry loops. This control helps ensure message durability, enables debugging of processing failures, prevents resource exhaustion from problematic messages, and supports compliance requirements for data retention and audit trails in distributed systems. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-no-public-access | CC6.1, CC6.3 | Preventing public access to SQS queues is critical for maintaining data confidentiality and preventing unauthorized message consumption or injection. Publicly accessible queues can expose sensitive information contained in messages, allow malicious actors to consume legitimate messages intended for authorized applications, or enable message flooding attacks that could disrupt service operations. Implementing proper access controls ensures that only authorized entities can interact with queue messages, supporting compliance with data protection regulations and maintaining the integrity of message- | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| | | based application architectures. | |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| sqs-queue-policy-full-access-check | CC6.1, CC6.3 | Overly permissive SQS queue policies can expose sensitive message data to unauthorized access and create security vulnerabilities. By monitoring for full access permissions, organizations can identify and remediate queue policies that violate the principle of least privilege. This control helps prevent unauthorized message consumption, modification, or deletion, and supports compliance with security frameworks that require proper access controls on messaging resources. Detecting overly broad permissions enables security teams to implement more restrictive policies that limit access to only | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| | | necessary actions and authorized principals. | |
| ssm-automation-block-public-sharing | CC6.1, CC6.3 | Enabling block public sharing on Systems Manager Documents prevents accidental exposure of sensitive automation workflows, scripts, and operational procedures to unauthorized users. This control helps maintain the confidentiality of organizational processes, reduces the risk of information disclosure, and ensures that automation documents containing potentially sensitive configuration details or business logic remain accessible only to authorized personnel within the organization. | Available in all commercial Regions except Asia Pacific (Melbourne). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| ssm-automation-logging-enabled | CC7.2 | Enabling CloudWatch logging for Systems Manager Automation provides essential visibility into automation execution activities, facilitating troubleshooting, audit trails, and operational monitoring. Comprehensive logging helps organizations track automation performance, identify failures quickly, meet compliance requirements for change management, and maintain detailed records of infrastructure modifications performed through automated workflows. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| stepfunctions-state-machine-tagged | CC2.1, CC6.1 | Tagging Step Functions state machines is essential for resource management, cost allocation, and operational visibilit y. Tags enable organizations to categorize workflows by environment, project, or business unit, facilitating accurate cost tracking and billing. Proper tagging also supports automated governance policies, simplifies resource discovery, and ensures complianc e with organizat ional standards for resource identification and management. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand ), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-last-backup-recovery-point-created | A1.2 | Regular recovery point creation is crucial for maintaining data resilience and enabling quick recovery for Storage Gateway volumes. Without recent recovery points, organizations risk data loss in case of volume failures or corruption. Implementing regular backups provides a reliable mechanism for data protection. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| storagegateway-resources-in-logically-air-gapped-vault | CC6.6 | Logical air-gapping is essential for protecting critical Storage Gateway data from unauthorized access and potential threats. This isolation helps prevent both accidental and malicious access to sensitive information. Implementing air-gapping provides an additional security barrier for critical Storage Gateway volume data. | Available in all commercial Regions except Asia Pacific (Malaysia), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Israel (Tel Aviv), and Mexico (Central). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| transfer-family-server-no-ftp | CC6.7 | FTP (File Transfer Protocol) establishes the endpoint connection through unencrypted channels, leaving data sent over these channels vulnerable to interception. Using SFTP (SSH File Transfer Protocol), FTPS (File Transfer Protocol Secure), or AS2 (Applicability Statement 2) offers an extra layer of security by encrypting your data in transit and can be used to help prevent potential attackers from using person-in-the-middle or similar attacks to eavesdrop on or manipulate network traffic. | Available in all commercial Regions except Canada West (Calgary). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-last-backup-recovery-point-created | A1.2 | Regular recovery point creation is crucial for maintaining virtual machine data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of VM failures. Implementing regular backups provides a reliable mechanism for virtual machine protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| virtualmachine-resources-in-logically-air-gapped-vault | A1.2 | Regular recovery point creation is crucial for maintaining volume data resilience and enabling quick recovery. Without recent recovery points, organizations risk extended downtime and data loss in case of volume failures. Implementing regular backups provides a reliable mechanism for volume protection. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Jakarta), Asia Pacific (Malaysia), Asia Pacific (Melbourne), Asia Pacific (New Zealand), Asia Pacific (Taipei), Asia Pacific (Thailand), Canada West (Calgary), Europe (Spain), Europe (Zurich), Israel (Tel Aviv), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| vpc-sg-port-restriction-check | CC6.1, CC6.6 | Controlling inbound access to sensitive ports is crucial for maintaining network security. Unrestricted access to ports like SSH (22) or RDP (3389) could lead to unauthorized system access and potential breaches. Implementing strict port access controls helps prevent unauthorized access to resources. | Available in all commercial Regions. Available in the AWS GovCloud (US) Regions. |
| wafv2-rulegroup-logging-enabled | CC6.6, CC7.2 | Enabling Amazon CloudWatch metrics for AWS Web Application Firewall (WAF) V2 rules and rule groups provides visibility into web traffic patterns, potential threats, and WAF enforcement actions. This data supports security monitoring, incident response, and continuous improvement of web application security posture. | Available in all commercial Regions. Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
|---|---|---|---|
| wafv2-webacl-not-empty | CC6.6 | Web access control lists (ACLs) without any configured rules or rule groups will not perform traffic inspection or filtering, allowing all web traffic to pass through unchecked. Configuring rules or rule groups enables enforcement of web application security policies. | Available in all commercial Regions except Asia Pacific (Hyderabad), Asia Pacific (Taipei), Asia Pacific (Thailand ), Canada West (Calgary), Europe (Spain), Europe (Zurich), Mexico (Central), and Middle East (UAE). Not available in the AWS GovCloud (US) Regions. |
| waf-global-rulegroup-not-empty | CC6.6 | AWS Web Application Firewall (WAF) Classic global rule groups, without any configured rules, will not inspect or filter web traffic, potentially allowing malicious or unauthorized traffic to pass through. Configuring rules enables traffic inspection and enforcement of security policies. | Available only in US East (N. Virginia). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-connection-alias-tagged | CC2.1, CC6.1 | Proper tagging of WorkSpaces connection aliases is essential for resource management, cost allocation, governance. Tags enable organizations to categorize resources by purpose, owner, environment, or cost center, facilitating accurate billing attribution resource tracking. Consistent tagging practices also support automated management workflows, security policies, compliance reporting requirements. Without proper tagging, organizations lose visibility into resource ownership usage patterns, making it difficult to optimize costs maintain operational control. | Available only in US East (N. Virginia), US West (Oregon), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-root-volume-encryption-enabled | CC6.1 | Root volume encryption is essential for protecting sensitive WorkSpaces data. Without encryption, operating system and application data could be exposed if storage systems are compromised. Implementing root volume encryption provides necessary data protection for virtual desktop environments. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-user-volume-encryption-enabled | CC6.1 | User volume encryption is crucial for protecting sensitive user data in virtual desktop environments. Without encryption, user files and data could be exposed if storage systems are compromised. Implementing user volume encryption provides necessary protection for end-user data. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Malaysia), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Available in AWS GovCloud (US-West). |

| AWS Config Rule | Control IDs | Guidance | Region availability |
| --- | --- | --- | --- |
| workspaces-workspace-tagged | CC2.1, CC6.1 | Proper tagging of WorkSpaces resources is essential for cost allocation, resource management, governance. Tags enable organizations to track ownership, categorize resources by department or project, implement automated policies, maintain compliance with internal standards. Without consistent tagging, organizations lose visibility into resource utilization, struggle with cost attribution, cannot effectively manage their virtual desktop infrastructure at scale. | Available only in US East (N. Virginia), US West (Oregon), Africa (Cape Town), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo), Canada (Central), Europe (Frankfurt), Europe (Ireland), Europe (London), and South America (Sao Paulo). Not available in the AWS GovCloud (US) Regions. |

# Custom Conformance Packs for AWS Config

A custom conformance pack is a unique collection of AWS Config rules and remediation actions that you can deploy together in an account and an AWS Region, or across an organization in AWS Organizations.

**Topics**

- Creating templates for Custom Conformance Packs for AWS Config
- Conformance Pack Sample Templates for AWS Config

# Creating templates for Custom Conformance Packs for AWS Config

To make a custom conformance pack, follow the steps in the following **Customizing the template** section to author a YAML file that contains the list of AWS Config Managed Rules or AWS Config Custom Rules that you want to work with.

**Topics**

- Terminology
- Customizing the template

## Terminology

*AWS Config Managed Rules* are predefined rules owned by AWS Config.

*AWS Config Custom Rules* are rules that you create from scratch.

There are two ways to create AWS Config custom rules: with Lambda functions (AWS Lambda Developer Guide) and with Guard (Guard GitHub Repository), a policy-as-code language. AWS Config custom rules created with AWS Lambda are called *AWS Config Custom Lambda Rules* and AWS Config custom rules created with Guard are called *AWS Config Custom Policy Rules*.

## Customizing the template

### Creating your YAML file

To create a YAML file, open a text editor and save the file as *.yaml*.

> **Note**
>
> Your file will contain a **Parameters** and **Resources** section.

### Parameters

The `Parameters` section in your YAML file is for the rule parameters for the set of AWS Config rules that you will add later in the `Resources` section. Create the `Parameters` section by copying and pasting the following code block into your YAML file, customizing it as needed and repeating for each rule parameter.

```
Parameters:
    NameOfRuleParamNameOfRuleParameter:
        Default: Parameter value
        Type: Type
    ...
```

For example:

```
Parameters:
    IamPasswordPolicyParamMinimumPasswordLength:
        Default: '14'
        Type: String
```

> **Note**
>
> When selecting the AWS Config Rules to build your custom conformance pack, check you have the resources provisioned within your account that will be evaluated for the AWS Config Rules.

1. The first line in the parameter section after `Parameters:` is a concatenated string of *`NameOfRule`* + Param + *`NameOfRuleParameter`*.
   a. Replace *`NameOfRule`* with a consistent name that you create for the rule. For example, that could be **IamPasswordPolicy** for the **iam-password-policy** rule.
   b. Type `Param`.
   c. Then, replace *`NameOfRuleParameter`* with the name of the rule parameter for your specific rule. For AWS Config Managed Rules, the name of the rule parameter is located in the List of AWS Config Managed Rules (for example, **MinimumPasswordLength** is a name of a rule parameter for the **iam-password-policy** rule). For AWS Config Custom Rules, the name of the rule parameter is the name that you chose when you created the rule.
2. If you are using an AWS Config Managed Rule, find the appropriate AWS Config rule in the list of managed rules so you'll know the accepted values for `Default` and `Type` for your particular rule. For AWS Config Custom Rules, use the values you selected when creating your rule.

> **Note**
>
> For each parameter, `Type` must be specified. `Type` can be one of "String", "int", "double", "CSV", "boolean" and "StringMap".

### Resources

The `Resources` section lists the rules that are being added to your Custom Conformance Pack. Add the following `Resources` block directly beneath your `Parameters` section, customizing it as needed and repeating for each rule. For more information on the specifications, see AWS::Config::ConfigRule.

```
Resources:
     NameOfRule:
        Properties:
            ConfigRuleName: ActualConfigRuleName
            InputParameters:
                NameOfRuleParameter: !Ref NameOfRuleParamNameOfRuleParameter
            Source:
                Owner: Owner
                SourceIdentifier: SOURCE_IDENTIFIER
        Type: AWS::Config::ConfigRule
     ...
```

For example:

```
Resources:
    IamPasswordPolicy:
        Properties:
            ConfigRuleName: iam-password-policy
            InputParameters:
                MinimumPasswordLength: !Ref IamPasswordPolicyParamMinimumPasswordLength
            Source:
                Owner: AWS
                SourceIdentifier: IAM_PASSWORD_POLICY
        Type: AWS::Config::ConfigRule
```

> **Note**
>
> When selecting the AWS Config rules to build your custom conformance pack, check that you have the resources that will be evaluated for the AWS Config rules provisioned within your account. For more information, see Supported Resource Types.

1. Replace *NameOfRule* with the same name you created in the `Parameters` section.
2. For AWS Config Managed Rules, replace *ActualConfigRuleName* with the title of the appropriate rule page on the List of AWS Config Managed Rules. For AWS Config Custom Rules, use the Config Rule name you chose at the time of the rule's creation.
3. Replace *NameOfRuleParameter* with the same name you used in the `Parameters` section. After the colon, copy and paste the same concatenated string of `!Ref` + *NameOfRule* + Param + *NameOfRuleParameter* that you created in `Parameters` section.
4. Change *Owner* to the appropriate value.

   > **Note**
   >
   > **AWS Config Managed Rules**
   > For AWS Config Managed Rules, the value for `Owner` will be `AWS`.
   > **AWS Config Custom Rules**
   > For AWS Config custom rules created with Guard, the value for `Owner` will be `CUSTOM_POLICY`. For AWS Config custom rules created with Lambda, the value for `Owner` will be `CUSTOM_LAMBDA`.

5. Change *SOURCE_IDENTIFIER* to the appropriate value.

   > **Note**
   >
   > **AWS Config Managed Rules**
   > For AWS Config Managed Rules, copy the identifier by following the link from the rule you select from the List of AWS Config Managed Rules (for example, the source identifier for the **access-keys-rotated** rule is **ACCESS_KEYS_ROTATED**).
   > **AWS Config Custom Rules**
   > For AWS Config custom rules created with Lambda, the `SourceIdentifier` is the Amazon Resource Name (ARN) of the rule's AWS Lambda function, such as `arn:aws:lambda:us-`

east-2:123456789012:function:*ActualConfigRuleName*. For AWS Config custom rules created with Guard, this field is not needed.

Altogether, your filled out custom conformance pack should begin to look similar to the following, which is an example using these AWS Config Managed Rules: **iam-password-policy**, **access-keys-rotated**, and **iam-user-unused-credentials-check**.

```
Parameters:
    IamPasswordPolicyParamMinimumPasswordLength:
        Default: '14'
        Type: String
    AccessKeysRotatedParamMaxAccessKeyAge:
        Default: '90'
        Type: String
    IamUserUnusedCredentialsCheckParamMaxCredentialUsageAge:
        Default: '45'
        Type: String
Resources:
    IamPasswordPolicy:
        Properties:
            ConfigRuleName: iam-password-policy
            InputParameters:
                MinimumPasswordLength: !Ref IamPasswordPolicyParamMinimumPasswordLength
            Source:
                Owner: AWS
                SourceIdentifier: IAM_PASSWORD_POLICY
        Type: AWS::Config::ConfigRule
    AccessKeysRotated:
        Properties:
            ConfigRuleName: access-keys-rotated
            InputParameters:
                maxAccessKeyAge: !Ref AccessKeysRotatedParamMaxAccessKeyAge
            Source:
                Owner: AWS
                SourceIdentifier: ACCESS_KEYS_ROTATED
        Type: AWS::Config::ConfigRule
    IamUserUnusedCredentialsCheck:
        Properties:
            ConfigRuleName: iam-user-unused-credentials-check
            InputParameters:
```

```
                maxCredentialUsageAge: !Ref
IamUserUnusedCredentialsCheckParamMaxCredentialUsageAge
            Source:
                Owner: AWS
                SourceIdentifier: IAM_USER_UNUSED_CREDENTIALS_CHECK
        Type: AWS::Config::ConfigRule
```

## Conformance Pack Sample Templates for AWS Config

Here are the conformance pack YAML templates that you see in AWS Config console. Within each conformance pack template, you can use one or more AWS Config rules and remediation actions. The AWS Config rules listed within the conformance pack can be AWS Config managed rules and/or AWS Config custom rules. You can download all the conformance pack templates from GitHub.

> **Important**
>
> Conformance packs provide a general-purpose compliance framework to help you create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. AWS conformance pack sample templates intend to help you create your own conformance packs with different or additional rules, input parameters and remediation actions that suit your environment. The sample templates, including those related to compliance standards and industry benchmarks, are not designed to ensure your compliance with a specific governance standard. They can neither replace your internal efforts nor guarantee that you will pass a compliance assessment.

> **Note**
>
> It is recommended that you review the rules available in the region where you deploy a conformance pack (List of AWS Config Managed Rules by Region Availability) and amend the template for rules not yet available in that region before deploying.

## AWS Control Tower Detective Guardrails Conformance Pack

This conformance pack contains AWS Config rules based on AWS Control Tower Detective Guardrails. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: AWS Control Tower Detective Guardrails Conformance Pack.

## Cyber Resilience Best Practices for Amazon S3, Amazon EBS, and Amazon DynamoDB

This conformance pack contains AWS Config rules based on Cyber Resilience Best Practices for Amazon S3, Amazon EBS, and Amazon DynamoDB. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Cyber Resilience Best Practices for Amazon S3, Amazon EBS, and Amazon DynamoDB.

## Operational Best Practices for ABS CCIG 2.0 Material Workloads

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the ABS Cloud Computing Implementation Guide 2.0 - Material Workloads and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ABS Cloud Computing Implementation Guide controls. An ABS Cloud Computing Implementation Guide control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-2-material-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| section4a-govern-the-cloud-2-material-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4a-govern-the-cloud-2-standard-workloads | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant . The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |
| section4a-govern-the-cloud-2-standard-workloads | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-2-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| section4a-govern-the-cloud-2-standard-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-2-standard-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| section4a-govern-the-cloud-2-standard-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applicati ons within the organizat ion is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| section4a-govern-the-cloud-2-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intellige nce feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-2-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-3-material-workloads | dynamodb-throughput-limit-check | Enable this rule to ensure that provisioned throughpu t capacity is checked on your Amazon DynamoDB tables. This is the amount of read/ write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughpu t requirements. This rule generates an alert when the throughput approache s the maximum limit for a customer's account. This rule allows you to optionall y set accountRCUThreshol dPercentage (Config Default: 80) and accountWCUThreshol dPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. |
| section4a-govern-the-cloud-3-material-workloads | lambda-concurrency-check | This rule ensures that a Lambda function's concurren cy high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-3-standard-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| section4a-govern-the-cloud-3-standard-workloads | ec2-stopped-instance | Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-3-standard-workloads | ec2-volume-inuse-check | This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functiona lity. |
| section4a-govern-the-cloud-3-standard-workloads | eip-attached | This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment. |
| section4a-govern-the-cloud-3-standard-workloads | vpc-network-acl-unused-check | This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitorin g for unused network access control lists can assist in accurate inventory and management of your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ecs-containers-nonprivileged | To assist with implementing the principle of least privilege, Amazon Elastic Container Service (Amazon ECS) task definitions should not have elevated privilege enabled. When this parameter is true, the container is given elevated privileges on the host container instance (similar to the root user). |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| section4b-design-and-secure-the-cloud-2-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-2-standard-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| section4b-design-and-secure-the-cloud-2-standard-workloads | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-2-standard-workloads | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |
| section4b-design-and-secure-the-cloud-2-standard-workloads | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-material-workloads | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |
| section4b-design-and-secure-the-cloud-3-material-workloads | elb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-material-workloads | elb-deletion-protection-enabled | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |
| section4b-design-and-secure-the-cloud-3-material-workloads | rds-instance-deletion-protection-enabled | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-material-workloads | rds-multi-az-support | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-material-workloads | rds-cluster-multi-az-enabled | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-material-workloads | s3-bucket-replication-enabled | Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained. |
| section4b-design-and-secure-the-cloud-3-standard-workloads | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |
| section4b-design-and-secure-the-cloud-3-standard-workloads | ec2-instance-detailed-monitoring-enabled | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance. |
| section4b-design-and-secure-the-cloud-3-standard-workloads | elb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | elb-deletion-protection-enabled | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |
| section4b-design-and-secure-the-cloud-3-standard-workloads | rds-enhanced-monitoring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | rds-multi-az-support | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | rds-cluster-multi-az-enabled | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | beanstalk-enhanced-health-reporting-enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |
| section4b-design-and-secure-the-cloud-4-material-workloads | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |
| section4b-design-and-secure-the-cloud-4-material-workloads | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| section4b-design-and-secure-the-cloud-4-material-workloads | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-4-material-workloads | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-4-material-workloads | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |
| section4b-design-and-secure-the-cloud-4-material-workloads | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |
| section4b-design-and-secure-the-cloud-4-material-workloads | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-4-material-workloads | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-4-material-workloads | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-4-material-workloads | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| section4b-design-and-secure-the-cloud-4-material-workloads | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |
| section4b-design-and-secure-the-cloud-4-material-workloads | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-material-workloads | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |
| section4b-design-and-secure-the-cloud-4-standard-workloads | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| section4b-design-and-secure-the-cloud-5-material-workloads | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period. |
| section4b-design-and-secure-the-cloud-5-material-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-5-material-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-5-material-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-5-material-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-5-standard-workloads | acm-certificate-expiration-check | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-5-standard-workloads | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-5-standard-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-5-standard-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-5-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-5-standard-workloads | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |
| section4b-design-and-secure-the-cloud-6-material-workloads | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-material-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-material-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-material-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-6-material-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-material-workloads | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | alb-http-drop-invalid-header-enabled | Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elasticsearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elbv2-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elb-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elb-tls-https-listeners-only | Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-material-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-8-material-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-material-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-8-material-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-material-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | access-keys-rotated | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |

| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-9-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4b-design-and-secure-the-cloud-10-material-workloads | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |
| section4b-design-and-secure-the-cloud-10-material-workloads | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| section4b-design-and-secure-the-cloud-10-material-workloads | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-10-material-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-10-material-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-10-material-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |
| section4b-design-and-secure-the-cloud-10-material-workloads | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |
| section4b-design-and-secure-the-cloud-10-material-workloads | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-10-material-workloads | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-10-material-workloads | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-10-material-workloads | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |
| section4b-design-and-secure-the-cloud-10-material-workloads | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-10-material-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-10-material-workloads | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| section4b-design-and-secure-the-cloud-10-material-workloads | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |
| section4b-design-and-secure-the-cloud-10-material-workloads | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-material-workloads | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | access-keys-rotated | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| section4b-design-and-secure-the-cloud-11-material-workloads | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| section4b-design-and-secure-the-cloud-11-material-workloads | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-11-material-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| section4b-design-and-secure-the-cloud-11-material-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-11-material-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| section4b-design-and-secure-the-cloud-11-material-workloads | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| section4b-design-and-secure-the-cloud-11-material-workloads | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-11-material-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| section4b-design-and-secure-the-cloud-11-material-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-11-material-workloads | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| section4b-design-and-secure-the-cloud-11-material-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-11-material-workloads | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| section4b-design-and-secure-the-cloud-11-material-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-11-material-workloads | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |
| section4b-design-and-secure-the-cloud-11-material-workloads | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | codebuild-project-envvar-awscred-check | Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | codebuild-project-source-repo-url-check | Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, sign-in credentials within AWS Codebuild project environments. Use OAuth instead of personal access tokens or sign-in credentials to grant authorization for accessing GitHub or Bitbucket repositories. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |
| section4b-design-and-secure-the-cloud-12-standard-workloads | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| section4b-design-and-secure-the-cloud-12-standard-workloads | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-material-workloads | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| section4b-design-and-secure-the-cloud-14-material-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-material-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |
| section4b-design-and-secure-the-cloud-14-material-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-material-workloads | cw-loggroup-retention-period-check | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. |
| section4b-design-and-secure-the-cloud-14-material-workloads | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-material-workloads | dynamodb-in-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| section4b-design-and-secure-the-cloud-14-material-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-material-workloads | rds-in-backup-plan | To help with data backup processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| section4b-design-and-secure-the-cloud-14-material-workloads | redshift-backup-enabled | To help with data backup processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-material-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloud-trail-log-file-validation-enabled | Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cw-loggroup-retention-period-check | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-default-lock-enabled | Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-policy-grantee-check | Manage access to the AWS Cloud by enabling s3_ bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |
| section4b-design-and-secure-the-cloud-15-material-workloads | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-material-workloads | dynamodb-in-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| section4b-design-and-secure-the-cloud-15-material-workloads | rds-in-backup-plan | To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-material-workloads | redshift-backup-enabled | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| section4b-design-and-secure-the-cloud-15-standard-workloads | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-default-lock-enabled | Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-policy-grantee-check | Manage access to the AWS Cloud by enabling s3_ bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-1-standard-workloads | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| section4c-run-the-cloud-2-material-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-material-workloads | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |
| section4c-run-the-cloud-2-standard-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| section4c-run-the-cloud-2-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| section4c-run-the-cloud-2-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4c-run-the-cloud-2-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4c-run-the-cloud-2-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |
| section4c-run-the-cloud-2-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4c-run-the-cloud-3-standard-workloads | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| section4c-run-the-cloud-3-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |
| section4c-run-the-cloud-3-standard-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| section4c-run-the-cloud-3-standard-workloads | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| section4c-run-the-cloud-3-standard-workloads | cloud-trail-log-file-validation-enabled | Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| section4c-run-the-cloud-3-standard-workloads | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |
| section4c-run-the-cloud-3-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |
| section4c-run-the-cloud-3-standard-workloads | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| section4c-run-the-cloud-3-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |
| section4c-run-the-cloud-3-standard-workloads | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |
| section4c-run-the-cloud-4-standard-workloads | response-plan-exists-maintained (process check) | Ensure incident response plans are established, maintained, and distributed to responsible personnel. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-4-material-workloads | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. |
| section4c-run-the-cloud-4-material-workloads | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |
| section4c-run-the-cloud-4-material-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-4-material-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4c-run-the-cloud-5-standard-workloads | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-5-standard-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| section4c-run-the-cloud-5-standard-workloads | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-5-standard-workloads | dynamodb-throughput-limit-check | Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. |
| section4c-run-the-cloud-5-standard-workloads | ec2-instance-detailed-monitoring-enabled | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-5-standard-workloads | lambda-concurrency-check | This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time. |
| section4c-run-the-cloud-5-standard-workloads | rds-enhanced-monitoring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-5-standard-workloads | beanstalk-enhanced-health-reporting-enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |
| section4c-run-the-cloud-6-material-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-6-material-workloads | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |
| section4c-run-the-cloud-6-material-workloads | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-6-material-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| section4c-run-the-cloud-6-material-workloads | guardduty-non-archived-findings | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-6-standard-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| section4c-run-the-cloud-6-standard-workloads | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-6-standard-workloads | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| section4c-run-the-cloud-6-standard-workloads | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

### Template

The template is available on GitHub: Operational Best Practices for ABS CCIG 2.0 Material Workloads.

## Operational Best Practices for ABS CCIG 2.0 Standard Workloads

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the ABS Cloud Computing Implementation Guide 2.0 - Standard Workloads and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ABS Cloud Computing Implementation Guide controls. An ABS Cloud Computing Implementation Guide control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-2-standard-workloads | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant . The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |
| section4a-govern-the-cloud-2-standard-workloads | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-2-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| section4a-govern-the-cloud-2-standard-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-2-standard-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| section4a-govern-the-cloud-2-standard-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applicati ons within the organizat ion is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| section4a-govern-the-cloud-2-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intellige nce feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-2-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4a-govern-the-cloud-3-standard-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-3-standard-workloads | ec2-stopped-instance | Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organizat ion's standards. |
| section4a-govern-the-cloud-3-standard-workloads | ec2-volume-inuse-check | This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functiona lity. |
| section4a-govern-the-cloud-3-standard-workloads | eip-attached | This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4a-govern-the-cloud-3-standard-workloads | vpc-network-acl-unused-check | This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ecs-containers-nonprivileged | To assist with implementing the principle of least privilege, Amazon Elastic Container Service (Amazon ECS) task definitions should not have elevated privilege enabled. When this parameter is true, the container is given elevated privileges on the host container instance (similar to the root user). |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | ecs-containers-readonly-access | Enabling read only access to Amazon Elastic Container Service (ECS) containers can assist in adhering to the principal of least privilege. This option can reduces attack vectors as the container instance's filesystem cannot be modified unless it has explicit read-write permissions. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | opensearch-access-control-enabled | Ensure fine-grained access control is enabled on your Amazon OpenSearch Service domains. Fine-grained access control provides enhanced authorization mechanisms to achieve least-privileged access to Amazon OpenSearch Service domains. It allows for role-based access control to the domain, as well as index, document, and field-level security, support for OpenSearch Service dashboards multi-tenancy, and HTTP basic authentication for OpenSearch Service and Kibana. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-1-standard-workloads | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |
| section4b-design-and-secure-the-cloud-1-standard-workloads | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| section4b-design-and-secure-the-cloud-2-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-2-standard-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| section4b-design-and-secure-the-cloud-2-standard-workloads | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-2-standard-workloads | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |
| section4b-design-and-secure-the-cloud-2-standard-workloads | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |
| section4b-design-and-secure-the-cloud-3-standard-workloads | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | ec2-instance-detailed-monitoring-enabled | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance. |
| section4b-design-and-secure-the-cloud-3-standard-workloads | elb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |
| section4b-design-and-secure-the-cloud-3-standard-workloads | elb-deletion-protection-enabled | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | rds-enhanced-monitoring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | rds-multi-az-support | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | rds-cluster-multi-az-enabled | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-3-standard-workloads | beanstalk-enhanced-health-reporting-enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |
| section4b-design-and-secure-the-cloud-4-standard-workloads | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |
| section4b-design-and-secure-the-cloud-4-standard-workloads | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-4-standard-workloads | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| section4b-design-and-secure-the-cloud-5-standard-workloads | acm-certificate-expiration-check | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired . This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-5-standard-workloads | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-5-standard-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-5-standard-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-5-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-5-standard-workloads | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | alb-http-drop-invalid-header-enabled | Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elasticsearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elasticsearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elbv2-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elb-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | elb-tls-https-listeners-only | Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | kinesis-stream-encrypted | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | kinesis-stream-encrypted | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-6-standard-workloads | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |
| section4b-design-and-secure-the-cloud-6-standard-workloads | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | access-keys-rotated | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-8-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-8-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-9-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-9-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-9-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | access-keys-rotated | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |
| section4b-design-and-secure-the-cloud-10-standard-workloads | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-10-standard-workloads | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | codebuild-project-envvar-awscred-check | Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | codebuild-project-source-repo-url-check | Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, sign-in credentials within AWS Codebuild project environments. Use OAuth instead of personal access tokens or sign-in credentials to grant authorization for accessing GitHub or Bitbucket repositories. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |
| section4b-design-and-secure-the-cloud-12-standard-workloads | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| section4b-design-and-secure-the-cloud-12-standard-workloads | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | kinesis-stream-encrypted | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-12-standard-workloads | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-12-standard-workloads | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cloud-trail-log-file-validation-enabled | Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | cw-loggroup-retention-period-check | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-default-lock-enabled | Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-policy-grantee-check | Manage access to the AWS Cloud by enabling s3_ bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-14-standard-workloads | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |
| section4b-design-and-secure-the-cloud-14-standard-workloads | opensearch-audit-logging-enabled | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-default-lock-enabled | Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-policy-grantee-check | Manage access to the AWS Cloud by enabling s3_ bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. |
| section4b-design-and-secure-the-cloud-15-standard-workloads | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-1-standard-workloads | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| section4c-run-the-cloud-2-standard-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| section4c-run-the-cloud-2-standard-workloads | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-standard-workloads | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| section4c-run-the-cloud-2-standard-workloads | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-standard-workloads | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| section4c-run-the-cloud-2-standard-workloads | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |
| section4c-run-the-cloud-2-standard-workloads | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-2-standard-workloads | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |
| section4c-run-the-cloud-2-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| section4c-run-the-cloud-3-standard-workloads | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| section4c-run-the-cloud-3-standard-workloads | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |
| section4c-run-the-cloud-3-standard-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| section4c-run-the-cloud-3-standard-workloads | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| section4c-run-the-cloud-3-standard-workloads | cloud-trail-log-file-validation-enabled | Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| section4c-run-the-cloud-3-standard-workloads | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |
| section4c-run-the-cloud-3-standard-workloads | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |
| section4c-run-the-cloud-3-standard-workloads | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| section4c-run-the-cloud-3-standard-workloads | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| section4c-run-the-cloud-3-standard-workloads | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |
| section4c-run-the-cloud-3-standard-workloads | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-3-standard-workloads | opensearch-audit-logging-enabled | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. |
| section4c-run-the-cloud-4-standard-workloads | response-plan-exists-maintained (process check) | Ensure incident response plans are established, maintained, and distributed to responsible personnel. |
| section4c-run-the-cloud-5-standard-workloads | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-5-standard-workloads | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| section4c-run-the-cloud-5-standard-workloads | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-5-standard-workloads | dynamodb-throughput-limit-check | Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. |
| section4c-run-the-cloud-5-standard-workloads | ec2-instance-detailed-monitoring-enabled | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-5-standard-workloads | lambda-concurrency-check | This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time. |
| section4c-run-the-cloud-5-standard-workloads | rds-enhanced-monitoring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-5-standard-workloads | beanstalk-enhanced-health-reporting-enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |
| section4c-run-the-cloud-6-standard-workloads | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-6-standard-workloads | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |
| section4c-run-the-cloud-6-standard-workloads | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| section4c-run-the-cloud-6-standard-workloads | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

### Template

The template is available on GitHub: Operational Best Practices for ABS CCIG 2.0 Standard Workloads.

## Operational Best Practices for ACSC Essential 8

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Australian Cyber Security Centre (ACSC) Essential Eight Maturity Model and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ACSC Essential Eight controls. An ACSC Essential Eight control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings. Some of the mappings to config rules are for the higher order section (eg. Mitigation Strategies to Limit the Extent of Cyber Security Incidents) as opposed to the more prescriptive sections.

This sample conformance pack template contains mappings to controls within the ACSC Essential 8, which was created by the Commonwealth of Australia and can be found at ACSC | Essential Eight. Licensing of the framework under Creative Commons Attribution 4.0 International Public License and copyright information for the framework (including a disclaimer of warranties) can be found at ACSC | Copyright.

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Application_control | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applicati ons or APIs against common web exploits. These web exploits may affect availabil ity, compromise security, or consume excessive resources within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Application_control | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |
| Application_control | cloudwatch-log-group-encrypted | Checks if Amazon CloudWatch Log Groups are encrypted with any AWS KMS key or a specified AWS KMS key Id. The rule is NON_COMPLIANT if a CloudWatch Log Group is not encrypted with a KMS key or is encrypted with a KMS key not supplied in the rule parameter. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Application_control | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| Application_control | waf-regional-rule-not-empty | Ensure your AWS WAF has a rule that is not empty. A rule with no conditions could result in unintended behavior. |
| Application_control | waf-regional-rulegroup-not-empty | Ensure your AWS WAF has a rule group that is not empty. A rule group that is empty could result in unintended behavior. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Application_control | waf-regional-webacl-not-empty | A Web ACL attached to an AWS WAF can contain a collection of rules and rule groups to inspect and control web requests. If a Web ACL is empty, the web traffic passes without being detected or acted upon by the WAF. |
| Application_control | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Patch_applications | ec2-imdsv2-check | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. |
| Patch_applications | ec2-instance-managed-by-sys tems-manager | An inventory of the software platforms and applicati ons within the organizat ion is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Patch_applications | ecs-fargate-latest-platform-version | Security updates and patches are deployed automatic ally for your AWS Fargate tasks. If a security issue is found that affects an AWS Fargate platform version, AWS patches the platform version. To assist in patch management of your Amazon Elastic Container Service (ECS) tasks running AWS Fargate, update your services standalone tasks to use the most recent platform version. |
| Patch_applications | ec2-instance-launched-with-allowed-ami | Checks if running or stopped EC2 instances were launched with Amazon Machine Images (AMIs) that meet your Allowed AMIs criteria. The rule is NON_COMPLIANT if an AMI doesn't meet the Allowed AMIs criteria and the Allowed AMIs settings isn't disabled. |
| Patch_applications | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environme nt ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Patch_applications | rds-automatic-minor-version-upgrade-enabled | Enable automatic minor version upgrades on your Amazon Relationa l Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. |
| Patch_applications | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Patch_applications | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| Restrict_administrative_privileges | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Restrict_administrative_privileges | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| Restrict_administrative_privileges | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Restrict_administrative_privileges | codebuild-project-environment-privileged-check | To assist with implementing the principle of least privilege, ensure your Amazon CodeBuild project environment does not have privileged mode enabled. This setting should be disabled to prevent unintended access to Docker APIs as well as the container's underlying hardware. |
| Restrict_administrative_privileges | ecs-containers-nonprivileged | To assist with implementing the principle of least privilege, Amazon Elastic Container Service (Amazon ECS) task definitions should not have elevated privilege enabled. When this parameter is true, the container is given elevated privileges on the host container instance (similar to the root user). |
| Restrict_administrative_privileges | ecs-containers-readonly-access | Enabling read only access to Amazon Elastic Container Service (ECS) containers can assist in adhering to the principal of least privilege. This option can reduces attack vectors as the container instance's filesystem cannot be modified unless it has explicit read-write permissions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Restrict_administrative_privileges | ecs-task-definition-nonroot-user | To assist with implementing the principle of least privilege, ensure that a non-root user is designated for access to your Amazon Elastic Container Service (Amazon ECS) task definitions. |
| Restrict_administrative_privileges | efs-access-point-enforce-user-identity | To assist with implementing the principle of least privilege, ensure user enforcement is enabled for your Amazon Elastic File System (Amazon EFS) .When enabled, Amazon EFS replaces the NFS client's user and group IDs with the identity configured on the access point for all file system operations and only grants access to this enforced user identity. |
| Restrict_administrative_privileges | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Restrict_administrative_privileges | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |
| Restrict_administrative_privileges | rds-instance-iam-authentication-enabled | Ensure an AWS Identity and Access Management (IAM) authentication is enabled on Amazon Relational Database Service (Amazon RDS) instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). You are not required to store user credentials in the database, as authentication is managed externally. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Restrict_administrative_privileges | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |
| Restrict_administrative_privileges | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Restrict_administrative_privileges | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Restrict_administrative_privileges | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| Restrict_administrative_privileges | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Patch_operating_systems | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documenta tion of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organizat ion's policies and procedures. |
| Multi-factor_authentication | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |
| Multi-factor_authentication | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Multi-factor_authentication | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| Multi-factor_authentication | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Multi-factor_authentication | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| Regular_backups | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Regular_backups | dynamodb-in-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| Regular_backups | ebs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Regular_backups | efs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| Regular_backups | elasticache-redis-cluster-automatic-backup-check | When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Regular_backups | rds-in-backup-plan | To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| Regular_backups | s3-bucket-default-lock-enabled | Checks if the S3 bucket has lock enabled, by default. The rule is NON_COMPLIANT if the lock is not enabled. |
| Regular_backups | s3-bucket-replication-enabled | Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Regular_backups | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. |
| Regular_backups | aurora-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Regular_backups | backup-plan-min-frequency-and-min-retention-check | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. |
| Regular_backups | backup-recovery-point-manual-deletion-disabled | Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| Regular_backups | ec2-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requireme nts. |
| Regular_backups | redshift-backup-enabled | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. |

### Template

The template is available on GitHub: Operational Best Practices for ACSC Essential 8.

## Operational Best Practices for ACSC ISM - Part 1

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Australian Cyber Security Centre (ACSC) Information Security Manual (ISM) 2020-06 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ISM controls. An ISM control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This sample conformance pack template contains mappings to controls within the ISM framework, which was created by the Commonwealth of Australia and can be found at Australian Government Information Security Manual. Licensing of the framework under Creative Commons Attribution 4.0 International Public License and copyright information for the framework (including a disclaimer of warranties) can be found at ACSC | Copyright.

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 43 | response-plan-exists-maintained (process check) | Ensure incident response plans are established, maintained, and distributed to responsible personnel. |
| 252 | security-awareness-program-exists (process check) | Establish and maintain a security awareness program for your organization. Security awareness programs educate employees on how to protect their organization from various security breaches or incidents. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 261 | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| 261 | elb-logging-enabled | Elastic Load Balancing (ELB) activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 261 | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched. |
| 298 | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documenta tion of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organizat ion's policies and procedures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 298 | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| 298 | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 298 | rds-automatic-minor-version-upgrade-enabled | Enable automatic minor version upgrades on your Amazon Relational Database Service (Amazon RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. |
| 380 | iam-group-has-users-check | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one user. Placing users in groups based on their associated permissions or job function is one way to incorporate least privilege. |
| 459 | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 459 | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| 459 | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| 459 | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (Amazon EFS). |
| 459 | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS volumes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 459 | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| 459 | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |
| 459 | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service(AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 459 | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |
| 459 | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |
| 459 | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| 459 | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service(AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 459 | backup-recovery-point-encrypted | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| 459 | codebuild-project-artifact-encryption | To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild artifacts. |
| 459 | codebuild-project-s3-logs-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild logs stored in Amazon S3. |
| 459 | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |
| 459 | kinesis-stream-encrypted | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Kinesis Streams. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 459 | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryptio n at rest to help protect that data. |
| 459 | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryptio n at rest to help protect that data. |
| 459 | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryptio n at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 580 | audit-log-policy-exists (process check) | Establish and maintain an audit log management policy that defines your organizat ion's logging requireme nts. This includes, but is not limited to, review and retention of audit logs. |
| 634 | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |
| 859 | cw-loggroup-retention-perio d-check | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 974 | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| 974 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management(IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1139 | elb-predefined-security-policy-ssl-check | To help protect data in transit, ensure that your Classic Elastic Load Balancing SSL listeners are using a predefined security policy. Elastic Load Balancing provides predefined SSL negotiation configurations that are used for SSL negotiation when a connection is established between a client and your load balancer. The SSL negotiation configurations provide compatibility with a broad range of clients and use high-strength cryptographic algorithms. This rule requires that you set a predefined security policy for your SSL listeners. The default security policy is: ELBSecurityPolicy-TLS-1-2-2017-0. The actual value should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1173 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| 1173 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1173 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |
| 1173 | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1173 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| 1228 | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1240 | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applicati ons or APIs against common web exploits. These web exploits may affect availabil ity, compromise security, or consume excessive resources within your environment. |
| 1240 | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |
| 1271 | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1271 | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |
| 1277 | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 1277 | rds-instance-iam-authentication-enabled | Ensure an AWS Identity and Access Management (IAM) authentication is enabled on Amazon Relational Database Service (Amazon RDS) instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). You are not required to store user credentials in the database, as authentication is managed externally. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1277 | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configure d with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |
| 1380 | ec2-imdsv2-check | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| 1380 | ecs-fargate-latest-platform-version | Security updates and patches are deployed automatically for your AWS Fargate tasks. If a security issue is found that affects an AWS Fargate platform version, AWS patches the platform version. To assist in patch management of your Amazon Elastic Container Service (ECS) tasks running AWS Fargate, update your services standalone tasks to use the most recent platform version. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |
| 1380 | rds-automatic-minor-version-upgrade-enabled | Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| 1380 | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 1380 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | codebuild-project-environment-privileged-check | To assist with implementing the principle of least privilege, ensure your Amazon CodeBuild project environment does not have privileged mode enabled. This setting should be disabled to prevent unintended access to Docker APIs as well as the container's underlying hardware. |
| 1380 | ecs-containers-nonprivileged | To assist with implementing the principle of least privilege, Amazon Elastic Container Service (Amazon ECS) task definitions should not have elevated privilege enabled. When this parameter is true, the container is given elevated privileges on the host container instance (similar to the root user). |
| 1380 | ecs-containers-readonly-access | Enabling read only access to Amazon Elastic Container Service (ECS) containers can assist in adhering to the principal of least privilege. This option can reduces attack vectors as the container instance's filesystem cannot be modified unless it has explicit read-write permissions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | ecs-task-definition-nonroot-user | To assist with implementing the principle of least privilege, ensure that a non-root user is designated for access to your Amazon Elastic Container Service (Amazon ECS) task definitions. |
| 1380 | efs-access-point-enforce-user-identity | To assist with implementing the principle of least privilege, ensure user enforcement is enabled for your Amazon Elastic File System (Amazon EFS) .When enabled, Amazon EFS replaces the NFS client's user and group IDs with the identity configured on the access point for all file system operations and only grants access to this enforced user identity. |
| 1380 | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | rds-instance-iam-authentication-enabled | Ensure an AWS Identity and Access Management (IAM) authentication is enabled on Amazon Relational Database Service (Amazon RDS) instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). You are not required to store user credentials in the database, as authentication is managed externally. |
| 1380 | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |
| 1380 | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricti ng policies from containin g blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1380 | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| 1380 | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1388 | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| 1388 | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1401 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |
| 1401 | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1401 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| 1401 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1401 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1402 | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUp percaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | actual values should reflect your organization's policies. |
| 1404 | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies. |
| 1405 | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1405 | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| 1405 | multi-region-cloudtrail-enabled | MULTI_REGION_CLOUD_TRAIL_ENABLED |
| 1405 | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1405 | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 1405 | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| 1405 | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1405 | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| 1405 | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1405 | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| 1405 | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1405 | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched. |
| 1405 | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1405 | codebuild-project-logging-enabled | Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed information about your build project. |
| 1405 | redshift-audit-logging-enabled | To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled. |
| 1405 | opensearch-audit-logging-enabled | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1405 | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 1490 | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. |
| 1490 | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1490 | waf-regional-rule-not-empty | Ensure your AWS WAF has a rule that is not empty. A rule with no conditions could result in unintended behavior. |
| 1490 | waf-regional-rulegroup-not-empty | Ensure your AWS WAF has a rule group that is not empty. A rule group that is empty could result in unintended behavior. |
| 1490 | waf-regional-webacl-not-empty | A Web ACL attached to an AWS WAF can contain a collection of rules and rule groups to inspect and control web requests. If a Web ACL is empty, the web traffic passes without being detected or acted upon by the WAF. |
| 1490 | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1501 | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documenta tion of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organizat ion's policies and procedures. |
| 1504 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |
| 1504 | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1504 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| 1504 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1504 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| 1509 | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| 1509 | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1509 | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |
| 1509 | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1509 | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 1509 | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| 1509 | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1509 | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| 1509 | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1509 | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| 1509 | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1509 | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched. |
| 1509 | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1509 | codebuild-project-logging-enabled | Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed information about your build project. |
| 1509 | redshift-audit-logging-enabled | To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled. |
| 1509 | opensearch-audit-logging-enabled | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1509 | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 1511 | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | dynamodb-in-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| 1511 | dynamodb-pitr-enabled | Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | ebs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| 1511 | efs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | elasticache-redis-cluster-automatic-backup-check | When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup. |
| 1511 | rds-in-backup-plan | To help with data backup processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. |
| 1511 | redshift-backup-enabled | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | aurora-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | backup-plan-min-frequency-and-min-retention-check | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | backup-recovery-point-minimum-retention-check | To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements. |
| 1511 | ec2-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | fsx-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| 1511 | s3-bucket-replication-enabled | Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1511 | backup-plan-min-frequency-and-min-retention-check | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. |
| 1511 | backup-recovery-point-manual-deletion-disabled | Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1515 | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |
| 1515 | dynamodb-in-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1515 | ebs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| 1515 | efs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1536 | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| 1537 | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1537 | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |
| 1552 | acm-certificate-expiration-check | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1552 | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 1552 | elb-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryptio n is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| 1552 | elb-tls-https-listeners-only | Ensure that your Elastic Load Balancers (ELBs) are configure d with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1552 | elbv2-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| 1579 | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1580 | elb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1580 | rds-multi-az-support | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchrono usly replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1580 | rds-cluster-multi-az-enabled | Amazon Relational Database Service (Amazon RDS) clusters should have Multi-AZ replication enabled to assist in the availability of the data that is stored. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |
| 1650 | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1650 | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| 1650 | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1650 | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| 1650 | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 1650 | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1650 | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| 1650 | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1650 | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1650 | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| 1650 | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1650 | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched. |
| 1650 | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1650 | codebuild-project-logging-enabled | Ensure AWS CodeBuild project logging is enabled so that your build output logs are sent to either Amazon CloudWatch or Amazon Simple Storage Service (Amazon S3). Build output logs provide detailed information about your build project. |
| 1650 | redshift-audit-logging-enabled | To capture information about connections and user activities on your Amazon Redshift cluster, ensure audit logging is enabled. |
| 1650 | opensearch-audit-logging-enabled | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1650 | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 1657 | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. |
| 1657 | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1657 | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| 1657 | waf-regional-rule-not-empty | Ensure your AWS WAF has a rule that is not empty. A rule with no conditions could result in unintended behavior. |
| 1657 | waf-regional-rulegroup-not-empty | Ensure your AWS WAF has a rule group that is not empty. A rule group that is empty could result in unintended behavior. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1657 | waf-regional-webacl-not-empty | A Web ACL attached to an AWS WAF can contain a collection of rules and rule groups to inspect and control web requests. If a Web ACL is empty, the web traffic passes without being detected or acted upon by the WAF. |
| 1657 | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |
| 1661 | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1661 | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| 1661 | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1661 | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| 1661 | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 1661 | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1661 | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| 1661 | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1661 | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1661 | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| 1661 | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1661 | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched. |
| 1661 | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1661 | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 1679 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |
| 1679 | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1679 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| 1679 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1679 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| 1680 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1680 | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| 1680 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1680 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| 1680 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |

| 1683 | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| 1690 | ec2-imdsv2-check | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1690 | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| 1690 | ecs-fargate-latest-platform-version | Security updates and patches are deployed automatically for your AWS Fargate tasks. If a security issue is found that affects an AWS Fargate platform version, AWS patches the platform version. To assist in patch management of your Amazon Elastic Container Service (ECS) tasks running AWS Fargate, update your services standalone tasks to use the most recent platform version. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1690 | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |
| 1690 | rds-automatic-minor-version-upgrade-enabled | Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1690 | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1690 | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| 1691 | ec2-imdsv2-check | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. |

| Control ID | AWS Config Rule | Guidance |

It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| 1694 | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1695 | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |
| 1707 | backup-recovery-point-manual-deletion-disabled | Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion. |
| P1 | rds-cluster-deletion-protection-enabled | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P1 | rds-instance-deletion-protection-enabled | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |
| P3 | ec2-imdsv2-check | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P5 | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregate s, organizes, and prioritiz es the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| P7 | elasticsearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communica tions within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P7 | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| P7 | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communica tions within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| P7 | opensearch-https-required | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P8 | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| P9 | aurora-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P9 | backup-plan-min-frequency-and-min-retention-check | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. |
| P9 | backup-recovery-point-encrypted | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P9 | backup-recovery-point-manual-deletion-disabled | Ensure that your AWS Backup recovery points have an attached resource-based policy which prevents deletion of recovery points. Using a resource-based policy to prevent deletion of recovery points can assist in preventing accidental or intentional deletion. |
| P9 | backup-recovery-point-minimum-retention-check | To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredR etentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P9 | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |
| P9 | dynamodb-in-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P9 | ebs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| P9 | ec2-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requireme nts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P9 | efs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| P9 | elasticache-redis-cluster-automatic-backup-check | When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P9 | fsx-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon FSx file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| P9 | rds-in-backup-plan | To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requireme nts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P9 | redshift-backup-enabled | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. |
| P10 | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P10 | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P10 | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricti ng policies from containin g blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P10 | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| P10 | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| P11 | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

### Template

These templates are available on GitHub:

- Operational Best Practices for ACSC ISM - Part 1
- Operational Best Practices for ACSC ISM - Part 2

## Operational Best Practices for ACSC ISM - Part 2

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides additional sample mapping between the Australian Cyber Security Centre (ACSC) Information Security Manual (ISM) 2020-06 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ISM controls. An ISM control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This sample conformance pack template contains mappings to controls within the ISM framework, which was created by the Commonwealth of Australia and can be found at Australian Government Information Security Manual. Licensing of the framework under Creative Commons Attribution 4.0 International Public License and copyright information for the framework (including a disclaimer of warranties) can be found at ACSC | Copyright.

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1984 | appmesh-virtual-gateway-backend-defaults-tls | Checks if backend defaults for AWS App Mesh virtual gateways require the virtual gateways to communicate with all ports using TLS. The rule is NON_COMPLIANT if configuration.Spec.BackendDefaults.ClientPolicy.Tls.Enforce is false. |
| 1984 | appmesh-virtual-node-backend-defaults-tls-on | Checks if backend defaults for AWS App Mesh virtual nodes require the virtual nodes to communicate with all ports using TLS. The rule is |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | NON_COMPLIANT if configuration.Spec.BackendDefaults.ClientPolicy.Tls.Enforce is false. |
| 1984 | msk-in-cluster-node-require-tls | Checks if an Amazon MSK cluster enforces encryption in transit using HTTPS (TLS) with the broker nodes of the cluster. The rule is NON_COMPLIANT if plain text communication is enabled for in-cluster broker node connections. |
| 1984 | rds-mysql-instance-encrypted-in-transit | Checks if connections to Amazon RDS for MySQL database instances are configured to use encryption in transit. The rule is NON_COMPLIANT if the associated database parameter group is not in-sync or if the require_secure_transport parameter is not set to 1. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1984 | rds-postgres-instance-encrypted-in-transit | Checks if connections to Amazon RDS for PostgreSQL database instances are configured to use encryption in transit. The rule is NON_COMPLIANT if the associated database parameter group is not in-sync or if the rds.force_ssl parameter is not set to 1. |
| 1985 | ebs-snapshot-public-restorable-check | Checks if Amazon Elastic Block Store (Amazon EBS) snapshots are not publicly restorable. The rule is NON_COMPLIANT if one or more snapshots with RestorableByUserIds field are set to all, that is, Amazon EBS snapshots are public. |
| 1985 | s3-bucket-mfa-delete-enabled | Checks if Amazon Elastic Block Store (Amazon EBS) snapshots are not publicly restorable. The rule is NON_COMPLIANT if one or more snapshots with RestorableByUserIds field are set to all, that is, Amazon EBS snapshots are public. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1985 | s3-bucket-public-read-prohibited | Checks if your Amazon S3 buckets do not allow public read access. The rule checks the Block Public Access settings, the bucket policy, and the bucket access control list (ACL).<br><br>The rule is compliant when both of the following are true:<br><br>• The Block Public Access setting restricts public policies or the bucket policy does not allow public read access.<br>• The Block Public Access setting restricts public ACLs or the bucket ACL does not allow public read access.<br><br>The rule is non-compliant when:<br><br>• If the Block Public Access setting does not restrict public policies, AWS Config evaluates whether the policy allows public read access. If the policy allows public read access, the rule is non-compliant.<br>• If the Block Public Access setting does not restrict |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| | | public bucket ACLs, AWS Config evaluates whether the bucket ACL allows public read access. If the bucket ACL allows public read access, the rule is non-compliant. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1985 | s3-bucket-public-write-prohibited | Checks if your Amazon S3 buckets do not allow public write access. The rule checks the Block Public Access settings, the bucket policy, and the bucket access control list (ACL).<br><br>The rule is compliant when both of the following are true:<br><br>• The Block Public Access setting restricts public policies or the bucket policy does not allow public write access.<br>• The Block Public Access setting restricts public ACLs or the bucket ACL does not allow public write access.<br><br>The rule is non-compliant when:<br><br>• If the Block Public Access setting does not restrict public policies, AWS Config evaluates whether the policy allows public write access. | --- | --- | --- |
| | | public bucket ACLs, AWS Config evaluates whether the bucket ACL allows public write access. If the bucket ACL allows public write access, the rule is non-compliant. |
| 1985 | aurora-resources-in-logically-air-gapped-vault | Checks if Amazon Aurora DB clusters are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon Aurora DB cluster is not in a logically air-gappe d vault within the specified time period. |
| 1985 | ebs-resources-in-logically-air-gapped-vault | Checks if Amazon Elastic Block Store (Amazon EBS) volumes are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon EBS volume is not in a logically air-gapped vault within the specified time period. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 1985 | ec2-resources-in-logically-air-gapped-vault | Checks if Amazon Elastic Block Store (Amazon EBS) instances are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon EBS instance is not in a logically air-gapped vault within the specified time period. |
| 1985 | efs-resources-in-logically-air-gapped-vault | Checks if Amazon Elastic File System (Amazon EFS) File Systems are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon EFS File System is not in a logically air-gappe d vault within the specified time period. |
| 1985 | s3-resources-in-logically-air-gapped-vault | Checks if Amazon Simple Storage Service (Amazon S3) buckets are in a logically air-gapped vault. The rule is NON_COMPLIANT if an Amazon S3 bucket is not in a logically air-gapped vault within the specified time period. |

### Template

This templates is available on GitHub: Operational Best Practices for ACSC ISM - Part 2.

## Operational Best Practices for Amazon API Gateway

This conformance pack contains AWS Config rules based on the usage of Amazon API Gateway within AWS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for Amazon API Gateway.

## Operational Best Practices for Amazon CloudWatch

This conformance pack contains AWS Config rules based on the usage of Amazon CloudWatch within AWS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for Amazon CloudWatch.

## Operational Best Practices for Amazon DynamoDB

The template is available on GitHub: Operational Best Practices for Amazon DynamoDB.

## Operational Best Practices for Amazon S3

The template is available on GitHub: Operational Best Practices for Amazon S3.

## Operational Best Practices for APRA CPG 234

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Australian Prudential Regulation Authority (APRA) CPG 234 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more APRA CPG 234 controls. An APRA CPG 234 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This sample conformance pack template contains mappings to controls within APRA CPG 234 2019, which was created by the Commonwealth of Australia and can be found at Prudential Practice Guide: CPG 234 Information Security. Licensing of the framework under Creative Commons Australia Attribution 3.0 Licence and copyright information for the framework (including a disclaimer of warranties) can be found at APRA | Copyright.

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36a | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, |

| Control ID | AWS Config Rule | Guidance |
|---|---|---|
| | | and other details about your environment. |
| 36a | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |
| 36a | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36b | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |
| 36b | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36b | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |
| 36b | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36b | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| 36b | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36b | rds-automatic-minor-version-upgrade-enabled | Enable automatic minor version upgrades on your Amazon Relationa l Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. |
| 36c | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36c | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 36c | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36c | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| 36c | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36c | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |
| 36c | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |
| 36c | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36c | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpecte d privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. |
| 36d | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| 36d | ebs-snapshot-public-restora ble-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| 36d | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |
| 36d | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorize d Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthori zed access to Amazon VPC resources. |
| 36d | lambda-function-public-acce ss-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |
| 36d | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |
| 36d | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |
| 36d | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| 36d | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | access-keys-rotated | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organizat ion's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authentic ate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principal s to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUp percaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
|---|---|---|
| | | actual values should reflect your organization's policies. |
| 36d | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 36d | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authoriza tions, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 36d | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| 36d | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies. |
| 36d | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| 36d | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | ec2-imdsv2-check | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. |
| 36d | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricti ng policies from containin g blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| 36d | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 36d | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privileges it is because the customer has specifically opted-in to those configurations. This control checks for unexpected privilege escalation when a task definition has host networking enabled but the customer has not opted-in to elevated privileges. |
| 36d | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |
| 36d | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| 36d | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |
| 36d | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36d | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| 36d | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connectio n. |
| 36e | secretsmanager-rotation-enabled-check | This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | secretsmanager-scheduled-rotation-success-check | This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised. |
| 36e | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| 36e | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| 36e | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |
| 36e | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorize d Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthori zed access to Amazon VPC resources. |
| 36e | lambda-function-public-acce ss-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |
| 36e | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |
| 36e | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |
| 36e | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| 36e | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |
| 36e | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestric ted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |
| 36e | s3-bucket-level-public-acce ss-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |
| 36e | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| 36e | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |
| 36e | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| 36e | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36e | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connectio n. |
| 36f | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| 36f | ebs-snapshot-public-restora ble-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| 36f | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |
| 36f | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorize d Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthori zed access to Amazon VPC resources. |
| 36f | lambda-function-public-acce ss-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |
| 36f | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |
| 36f | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |
| 36f | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| 36f | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |
| 36f | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| 36f | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |
| 36f | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestric ted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |
| 36f | s3-bucket-level-public-acce ss-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |
| 36f | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| 36f | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |
| 36f | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| 36f | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36f | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connectio n. |
| 36g | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregate s, organizes, and prioritiz es the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36g | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| 36g | guardduty-non-archived-findings | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36h | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| 36h | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36h | guardduty-non-archived-findings | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. |
| 36h | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36h | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |
| 36h | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36h | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| 36h | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36i | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36i | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36i | dynamodb-throughput-limit-check | Enable this rule to ensure that provisioned throughpu t capacity is checked on your Amazon DynamoDB tables. This is the amount of read/ write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughpu t requirements. This rule generates an alert when the throughput approache s the maximum limit for a customer's account. This rule allows you to optionall y set accountRCUThreshol dPercentage (Config Default: 80) and accountWCUThreshol dPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. |
| 36i | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intellige nce feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36i | lambda-concurrency-check | This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time. |
| 36i | lambda-dlq-check | Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed. |
| 36i | rds-enhanced-monitoring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36i | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 36i | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36i | beanstalk-enhanced-health-reporting-enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |
| 36i | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36j | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| 36j | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36j | guardduty-non-archived-findings | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. |
| 36j | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36j | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36j | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36j | dynamodb-throughput-limit-check | Enable this rule to ensure that provisioned throughpu t capacity is checked on your Amazon DynamoDB tables. This is the amount of read/ write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughpu t requirements. This rule generates an alert when the throughput approache s the maximum limit for a customer's account. This rule allows you to optionall y set accountRCUThreshol dPercentage (Config Default: 80) and accountWCUThreshol dPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. |
| 36j | lambda-dlq-check | Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notificat ion Service (Amazon SNS) when a function has failed. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36j | rds-enhanced-monitoring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |
| 36j | beanstalk-enhanced-health-reporting-enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36j | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| 36l | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provision ed throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |
| 36l | dynamodb-pitr-enabled | Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | elasticache-redis-cluster-automatic-backup-check | When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup. |
| 36l | elb-deletion-protection-enabled | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | rds-multi-az-support | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchrono usly replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | rds-cluster-multi-az-enabled | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchrono usly replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | s3-bucket-replication-enabled | Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained. |
| 36l | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implement ed to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectiv ity, in case your customer gateway becomes unavailab le, you can set up a second Site-to-Site VPN connectio n to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | dynamodb-in-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| 36l | ebs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | efs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| 36l | elb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | rds-instance-deletion-protection-enabled | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |
| 36l | rds-in-backup-plan | To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 36l | redshift-backup-enabled | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. |
| 36l | beanstalk-enhanced-health-reporting-enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 39(a)(b)(d) | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| 39(a)(b)(d) | guardduty-non-archived-findings | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 39(a)(b)(d) | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| 40 | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 40 | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |
| 40 | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 40 | rds-automatic-minor-version-upgrade-enabled | Enable automatic minor version upgrades on your Amazon Relationa l Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. |
| 44a | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 44a | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| 44a | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 44b | rds-instance-deletion-protection-enabled | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |
| 44b | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. |
| 44b | elb-deletion-protection-enabled | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 44c | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |
| 44c | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 44c | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricti ng policies from containin g blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 44c | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 45 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 45 | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| 45 | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies. |
| 45 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| 45 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authentic ate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principal s to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| 45 | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| 45 | ebs-snapshot-public-restora ble-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| 45 | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |
| 45 | restricted-ssh | Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorize d Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthori zed access to Amazon VPC resources. |
| 45 | lambda-function-public-acce ss-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |
| 45 | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |
| 45 | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | restricted-common-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies. |
| 45 | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| 45 | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |
| 45 | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |
| 45 | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant . The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricti ng policies from containin g blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| 45 | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 45 | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |
| 45 | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| 45 | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| 45 | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connectio n. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 45 | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |
| 45 | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 47c | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authentic ate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principal s to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 47c | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 47c | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 47c | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 47c | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 47c | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |
| 47c | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| 52c | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |
| 52c | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52c | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |
| 52c | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| 52c | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |
| 52c | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52c | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryptio n at rest to help protect that data. |
| 52c | redshift-cluster-configurat ion-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activitie s in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52c | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| 52c | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| 52c | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52c | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryptio n at rest to help protect that data. |
| 52c | ec2-ebs-encryption-by-defau lt | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| 52c | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52c | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryptio n at rest to help protect that data. |
| 52c | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |
| 52c | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |
| 52c | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| 52d | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| 52d | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| 52d | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |
| 52d | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |
| 52d | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorize d Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthori zed access to Amazon VPC resources. |
| 52d | lambda-function-public-acce ss-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |
| 52d | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |
| 52d | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |
| 52d | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| 52d | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |
| 52d | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| 52d | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connectio n. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52d | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 52e | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| 52e | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| 53 | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| 53 | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventin g direct internet access, you can keep sensitive data from being accessed by unauthori zed users. |
| 53 | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| 53 | ebs-snapshot-public-restora ble-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| 53 | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |
| 53 | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorize d Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthori zed access to Amazon VPC resources. |
| 53 | lambda-function-public-acce ss-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potential ly lead to degradation of availability of resources. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |
| 53 | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |
| 53 | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |
| 53 | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |
| 53 | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| 53 | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |
| 53 | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 53 | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |
| 54 | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |
| 54 | acm-certificate-expiration-check | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired . This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 54 | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 54 | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |
| 54 | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| 54 | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |
| 54 | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 54 | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |
| 54 | elb-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryptio n is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| 54 | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 54 | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryptio n at rest to help protect that data. |
| 54 | redshift-cluster-configurat ion-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activitie s in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 54 | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 54 | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 54 | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 54 | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 54 | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| 54 | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 54 | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryptio n at rest to help protect that data. |
| 54 | ec2-ebs-encryption-by-defau lt | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| 54 | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryptio n at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 54 | elasticsearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 54 | elb-tls-https-listeners-only | Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 54 | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 54 | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configure d with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |
| 54 | elbv2-acm-certificate-requi red | Because sensitive data can exist and to help protect data at transit, ensure encryptio n is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| 55 | elasticsearch-node-to-node- encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communica tions within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 55 | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 67 | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| 67 | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 67 | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| 67 | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| 67 | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 67 | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 67 | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| 67 | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 67 | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| 67 | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 67 | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |
| 67 | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 67 | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregate s, organizes, and prioritiz es the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| 67 | opensearch-logs-to-cloudwat ch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 67 | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |
| 67 | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 67 | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |
| 67 | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 68 | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| 68 | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| 73 | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| 73 | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(b)(h) | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authentic ate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principal s to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(b)(h) | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| AttachmentA_1(b)(h) | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(b)(h) | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authoriza tions, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| AttachmentA_1(b)(h) | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(b)(h) | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(b)(h) | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricti ng policies from containin g blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(b)(h) | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| AttachmentA_1(b)(h) | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(b)(h) | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |
| AttachmentA_1(c) | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregate s, organizes, and prioritiz es the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| AttachmentA_1(c) | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intellige nce feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(e) | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregate s, organizes, and prioritiz es the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |
| AttachmentA_1(e) | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intellige nce feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(e) | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |
| AttachmentA_1(e) | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| AttachmentA_1(e) | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(e) | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| AttachmentA_1(e) | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| AttachmentA_1(e) | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentA_1(e) | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | AWS Config Rule | Guidance |

| AttachmentA_1(e) | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| AttachmentA_1(e) | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |
| AttachmentB_1 | security-awareness-program-exists (process check) | Establish and maintain a security awareness program for your organization. Security awareness programs educate employees on how to protect their organizat ion from various security breaches or incidents. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | access-keys-rotated | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organizat ion's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authentic ate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principal s to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUp percaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
|---|---|---|
| | | actual values should reflect your organization's policies. |
| AttachmentC_4 | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| AttachmentC_4 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| AttachmentC_4 | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |
| AttachmentC_4 | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies. |
| AttachmentC_4 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| AttachmentC_4 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| AttachmentC_4 | secretsmanager-rotation-enabled-check | This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | secretsmanager-scheduled-rotation-success-check | This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised. |
| AttachmentC_4 | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricti ng policies from containin g blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | iam-inline-policy-blocked-kms-actions | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies. |
| AttachmentC_4 | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_4 | iam-policy-no-statements-with-full-access | Ensure IAM Actions are restricted to only those actions that are needed. Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |
| AttachmentC_5 | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_5 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| AttachmentC_5 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_5 | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_5 | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUp percaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The |

| Control ID | AWS Config Rule | Guidance |
|---|---|---|
| | | actual values should reflect your organization's policies. |
| AttachmentC_6 | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| AttachmentC_6 | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_6 | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |
| AttachmentC_7(c) | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-base d AWS accounts to help to incorporate the principle of least functionality. |
| AttachmentC_7(h) | api-gw-execution-logging-en abled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(h) | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| AttachmentC_7(h) | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| AttachmentC_7(h) | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(h) | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |
| AttachmentC_7(h) | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(h) | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| AttachmentC_7(h) | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(h) | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| AttachmentC_7(h) | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregate s, organizes, and prioritiz es the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(h) | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |
| AttachmentC_7(h) | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| AttachmentC_7(h) | opensearch-logs-to-cloudwat ch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(h) | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched. |
| AttachmentC_7(h) | elasticsearch-logs-to-cloud watch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(i) | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissio ns and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsage Age (Config Default: 90). The actual value should reflect your organization's policies. |
| AttachmentC_7(j) | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for users. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(j) | mfa-enabled-for-iam-console-access | Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of sign-in credentials. By requiring MFA for users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users. |
| AttachmentC_7(j) | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for sign-in credentials. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_7(j) | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |
| AttachmentC_8 | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |
| AttachmentC_8 | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_8 | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| AttachmentC_8 | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |
| AttachmentC_8 | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_8 | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_8 | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_8 | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |
| AttachmentC_8 | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_8 | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |
| AttachmentC_8 | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, informati on about the request, and an action for the rule that each request matched. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentC_8 | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |
| AttachmentD_1 | codebuild-project-envvar-awscred-check | Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access. |
| AttachmentD_1 | codebuild-project-source-repo-url-check | Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, sign-in credentials within AWS Codebuild project environments. Use OAuth instead of personal access tokens or sign-in credentials to grant authorization for accessing GitHub or Bitbucket repositories. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_4 | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |
| AttachmentE_4 | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period. |
| AttachmentE_5(d) | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period. |
| AttachmentE_1(a)(b)(d) | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_1(a)(b)(d) | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| AttachmentE_1(a)(b)(d) | acm-certificate-expiration-check | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired . This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. |
| AttachmentE_1(a)(b)(d) | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_1(a)(b)(d) | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |
| AttachmentE_1(a)(b)(d) | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| AttachmentE_1(a)(b)(d) | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |
| AttachmentE_1(a)(b)(d) | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| AttachmentE_1(a)(b)(d) | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_1(a)(b)(d) | elb-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryptio n is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| AttachmentE_1(a)(b)(d) | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |
| AttachmentE_1(a)(b)(d) | kms-cmk-not-scheduled-for-d eletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_1(a)(b)(d) | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryptio n at rest to help protect that data. |
| AttachmentE_1(a)(b)(d) | redshift-cluster-configurat ion-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activitie s in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_1(a)(b)(d) | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| AttachmentE_1(a)(b)(d) | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| AttachmentE_1(a)(b)(d) | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_1(a)(b)(d) | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| AttachmentE_1(a)(b)(d) | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |
| AttachmentE_1(a)(b)(d) | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_1(a)(b)(d) | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| AttachmentE_1(a)(b)(d) | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| AttachmentE_1(a)(b)(d) | elasticsearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | AWS Config Rule | Guidance |
| --- | --- | --- |
| AttachmentE_1(a)(b)(d) | elb-tls-https-listeners-only | Ensure that your Elastic Load Balancers (ELBs) are configure d with SSL or HTTPS listeners . Because sensitive data can exist, enable encryption in transit to help protect that data. |
| AttachmentE_1(a)(b)(d) | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |
| AttachmentE_1(a)(b)(d) | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configure d with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |

**Template**

The template is available on GitHub: Operational Best Practices for APRA CPG 234.

## Operational Best Practices for Asset Management

This conformance pack contains AWS Config rules based on asset management within AWS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for Asset Management.

## Operational Best Practices for AWS Backup

This conformance pack contains AWS Config rules based on AWS Backup within AWS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for AWS Backup.

## Operational Best Practices for AWS Identity And Access Management

The template is available on GitHub: Operational Best Practices for AWS Identity And Access Management.

## Operational Best Practices for AWS Well-Architected Framework Reliability Pillar

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between Amazon Web Services' Well-Architected Framework Reliability Pillar and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more of the pillar's design principles. A Well-Architected Framework category can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-1 | How do you manage service quotas and constraints? For cloud-based workload architectures, there are service quotas (which are also referred to as service limits). These quotas exist to prevent accidentally provisioning more resources than you need and to limit request rates on API operations so as to protect services from abuse. There are also resource constraints, for example, the rate | dynamodb-throughput-limit-check | Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| | that you can push bits down a fiber-optic cable, or the amount of storage on a physical disk. | | customer's account. This rule allows you to optionall y set accountRC UThresholdPercenta ge (Config Default: 80) and accountWC UThresholdPercenta ge (Config Default: 80) parameters. The actual values should reflect your organizat ion's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-1 | How do you manage service quotas and constraints? For cloud-based workload architectures, there are service quotas (which are also referred to as service limits). These quotas exist to prevent accidentally provisioning more resources than you need and to limit request rates on API operations so as to protect services from abuse. There are also resource constraints, for example, the rate that you can push bits down a fiber-optic cable, or the amount of storage on a physical disk. | lambda-concurrency-check | This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-1 | How do you manage service quotas and constraints? For cloud-based workload architectures, there are service quotas (which are also referred to as service limits). These quotas exist to prevent accidentally provisioning more resources than you need and to limit request rates on API operations so as to protect services from abuse. There are also resource constraints, for example, the rate that you can push bits down a fiber-optic cable, or the amount of storage on a physical disk. | ecs-task-definition-memory-hard-limit | Limiting the maximum memory available to your Amazon Elastic Container Service (ECS) containers ensures that your resource usage cannot be abused in the event of malicious access to your containers. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-2 | How do you plan your network topology? Workloads often exist in multiple environments. These include multiple cloud environments (both publicly accessible and private) and possibly your existing data center infrastructure. Plans must include network considerations such as intra- and inter-system connectivity, public IP address management, private IP address management, and domain name resolution. | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-2 | How do you plan your network topology? Workloads often exist in multiple environments. These include multiple cloud environments (both publicly accessible and private) and possibly your existing data center infrastructure. Plans must include network considerations such as intra- and inter-system connectivity, public IP address management, private IP address management, and domain name resolution. | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-2 | How do you plan your network topology? Workloads often exist in multiple environments. These include multiple cloud environments (both publicly accessible and private) and possibly your existing data center infrastructure. Plans must include network considerations such as intra- and inter-system connectivity, public IP address management, private IP address management, and domain name resolution. | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-5 | How do you Design Interactions in a Distributed System to Mitigate or Withstand Failures? Distributed systems rely on communications networks to interconnect components, such as servers or services. Your workload must operate reliably despite data loss or latency in these networks. Components of the distributed system must operate in a way that does not negatively impact other components or the workload. These best practices prevent failures and improve mean time between failures (MTBF). | lambda-dlq-check | Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |

| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | api-gw-xray-enabled | AWS X-Ray collects data about requests that your application serves, and provides tools you can use to view, filter, and gain insights into that data to identify issues and opportuni ties for optimizat ion. Ensure X-Ray is enables so you can see detailed informati on not only about the request and response, but also about calls that your application makes to downstream AWS resources, microserv ices, databases and HTTP web APIs. |

| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | api-gw-execution-l ogging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | beanstalk-enhanced -health-reporting- enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastru cture. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | cloudwatch-alarm-a ction-check | Amazon CloudWatc h alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequire d (Config Default: True), insuffici entDataActionRequi red (Config Default: True), okActionR equired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | cloudtrail-enabled | AWS CloudTrail can help in non-repud iation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated , and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | cloudtrail-s3-data events-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearc h Service error logs can assist with security and access audits, and can help to diagnose availabil ity issues. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | ecs-container-insi ghts-enabled | Monitoring is an important part of maintaining the reliability, availabil ity, and performan ce of Amazon Elastic Container Service (ECS) and your AWS solutions. Container Insights also provides diagnostic informati on, such as container restart failures, to help you isolate issues and resolve them quickly. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environme nt. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains informati on such as the time the request was received, the client's IP address, latencies , request paths, and server responses. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | multi-region-cloud trail-enabled | AWS CloudTrai l records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REG ION_CLOUD _TRAIL_ENABLED is enabled. Additiona lly, when AWS launches a new Region, CloudTrai l will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | rds-logging-enabled | To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | ec2-instance-detai led-monitoring-ena bled | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitorin g on the Amazon EC2 console, which displays monitorin g graphs with a 1-minute period for the instance. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | lambda-dlq-check | Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | rds-enhanced-monit oring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availabil ity. This provides detailed visibility into the health of your Amazon RDS database instances . When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | vpc-flow-logs-enab led | The VPC flow logs provide detailed records for informati on about the IP traffic going to and from network interface s in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-6 | How do you monitor workload resources ? Logs and metrics are powerful tools to gain insight into the health of your workload. You can configure your workload to monitor logs and metrics and send notifications when thresholds are crossed or significa nt events occur. Monitoring enables your workload to recognize when low-performance thresholds are crossed or failures occur, so it can recover automatically in response. | wafv2-logging-enab led | To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-7 | How do you design your workload to adapt to changes in demand? A scalable workload provides elasticity to add or remove resources automatically so that they closely match the current demand at any given point in time. | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |

| Control ID | Control Description | AWS Config Rule | Guidance |

| REL-8 | How do you implement change? Controlled changes are necessary to deploy new functionality, and to ensure that the workloads and the operating environment are running known software and can be patched or replaced in a predictable manner. If these changes are uncontrolled, then it makes it difficult to predict the effect of these changes, or to address issues that arise because of them. | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-8 | How do you implement change? Controlled changes are necessary to deploy new functionality, and to ensure that the workloads and the operating environment are running known software and can be patched or replaced in a predictable manner. If these changes are uncontrolled, then it makes it difficult to predict the effect of these changes, or to address issues that arise because of them. | rds-automatic-minor-version-upgrade-enabled | Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed, which may include security patches and bug fixes. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-8 | How do you implement change? Controlled changes are necessary to deploy new functionality, and to ensure that the workloads and the operating environment are running known software and can be patched or replaced in a predictable manner. If these changes are uncontrolled, then it makes it difficult to predict the effect of these changes, or to address issues that arise because of them. | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-8 | How do you implement change? Controlled changes are necessary to deploy new functionality, and to ensure that the workloads and the operating environment are running known software and can be patched or replaced in a predictable manner. If these changes are uncontrolled, then it makes it difficult to predict the effect of these changes, or to address issues that arise because of them. | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | aurora-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | backup-plan-min-frequency-and-min-retention-check | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | backup-recovery-point-minimum-retention-check | To help with data back-up processes, ensure your AWS Backup recovery points have a minimum retention period set. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredRetentionDays (config default: 35) parameter. The actual value should reflect your organizations requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | backup-recovery-point-encrypted | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | dynamodb-in-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | dynamodb-pitr-enabled | Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | ebs-in-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |

| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | rds-instance-deletion-protection-enabled | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | s3-bucket-default-lock-enabled | Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | s3-bucket-replication-enabled | Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained. |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | ebs-optimized-instance | An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | redshift-backup-enabled | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-9 | How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO). | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-10 | How do you use fault isolation to protect your workload? Fault isolated boundaries limit the effect of a failure within a workload to a limited number of components. Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload. | elb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-10 | How do you use fault isolation to protect your workload? Fault isolated boundaries limit the effect of a failure within a workload to a limited number of components. Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload. | clb-multiple-az | Elastic Load Balancing (ELB) automatically distributes your incoming traffic across multiple targets, such as EC2 instances, containers, and IP addresses, in an availability zone. To ensure high availability, ensure your ELB has registered instances from multiple Availability Zones. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-10 | How do you use fault isolation to protect your workload? Fault isolated boundaries limit the effect of a failure within a workload to a limited number of components. Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload. | elbv2-multiple-az | Elastic Load Balancing (ELB) automatically distributes your incoming traffic across multiple targets, such as EC2 instances, containers, and IP addresses, in an availability zone. To ensure high availability, ensure your ELB has registered instances from multiple Availability Zones. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-10 | How do you use fault isolation to protect your workload? Fault isolated boundaries limit the effect of a failure within a workload to a limited number of components. Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload. | lambda-vpc-multi-az-check | If your AWS Lambda function is configured to connect to a virtual private cloud (VPC) in your account, deploy the AWS Lambda function in at least two different Availability Zones to ensure that it is your function is available to process events in case of a service interruption in a single zone. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-10 | How do you use fault isolation to protect your workload? Fault isolated boundaries limit the effect of a failure within a workload to a limited number of components. Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload. | opensearch-data-node-fault-tolerance | Amazon OpenSearch Service (OpenSearch Service) requires at least three data nodes for high availability and fault-tolerance. Deploying an OpenSearch Service domain with at least three data nodes ensures cluster operations if a node fails. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| REL-10 | How do you use fault isolation to protect your workload? Fault isolated boundaries limit the effect of a failure within a workload to a limited number of components. Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload. | rds-multi-az-support | Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | Control Description | AWS Config Rule | Guidance |

Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload. | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |

### Template

The template is available on GitHub: Operational Best Practices for AWS Well-Architected Reliability Pillar.

## Operational Best Practices for AWS Well-Architected Framework Security Pillar

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between Amazon Web Services' Well-Architected Framework Security Pillar and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more of the pillar's design principles. A Well-Architected Framework category can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-1 | How do you securely operate your workload? To operate your workload securely, you must apply overarching best practices to every area of security. Take requirements and processes that you have defined in operational excellence at an organizational and workload level, and apply them to all areas. Staying up to date with AWS and industry recommendations and threat intelligence helps | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |

Have a clear definition of who or what should have access to each component, choose the appropriate identity type and method of authentication and authorization. | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissions for people and machines? Establish common controls that restrict access to all identities in your organization. For example, you can restrict access to specific AWS Regions, or prevent your operators from deleting common resources, such as an IAM role used for your central security team | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | ec2-instance-no-pu blic-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearc h Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearc h Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requireme nt for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | secretsmanager-secret-unused | If unused credentials exist in AWS Secrets Manager, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule allows you to set a value to the unusedForDays (Config Default: 90). The actual value should reflect your organization's policies. |
| SEC-3 | How do you manage permissions for people and machines? Continuously monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |
| SEC-3 | How do you manage permissio ns for people and machines? Continuou sly monitor findings that highlight public and cross account access. Reduce public access and cross account access to only resources that require this type of access. | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associate d resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessibl e, as this may allow unintended access to your applications or servers. |

| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | opensearch-audit-logging-enabled | Ensure audit logging is enabled on your Amazon OpenSearch Service domains. Audit logging allows you to track user activity on your OpenSearch domains, including authentication successes and failures, requests to OpenSearch, index changes, and incoming search queries. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | cloudtrail-s3-data events-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an object in an Amazon S3 bucket, IP address, and time of event. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | cw-loggroup-retention-period-check | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | elasticsearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. Domain error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | multi-region-cloudtrail-enabled | AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | rds-logging-enabled | To help with logging and monitorin g within your environment, ensure Amazon Relationa l Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connectio ns, disconnections, queries, or tables queried. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | wafv2-logging-enabled | To help with logging and monitorin g within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDb Encrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-4 | How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload. | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | elasticsearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service (OpenSearch Service) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An OpenSearch Service domain within an Amazon VPC enables secure communication between OpenSearc h Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearc h Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | ec2-instances-in-vpc | Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communica tion between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints . Assign Amazon EC2 instances to an Amazon VPC to properly manage access. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requireme nt for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | alb-waf-enabled | Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorabl e. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | ec2-instance-multi ple-eni-check | This rule checks if your Amazon Elastic Compute Cloud (Amazon EC2) instances have multiple ENIs. Having multiple ENIs can cause dual-homed instances, meaning instances that have multiple subnets. This can add network security complexit y and introduce unintended network paths and access. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectivity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectivity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | emr-master-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectivity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectivity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectiv ity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | waf-regional-rule-not-empty | Ensure your AWS WAF has a rule that is not empty. A rule with no condition s could result in unintended behavior. |
| SEC-5 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | waf-regional-rulegroup-not-empty | Ensure your AWS WAF has a rule group that is not empty. A rule group that is empty could result in unintended behavior. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | waf-regional-webacl-not-empty | A Web ACL attached to an AWS WAF can contain a collectio n of rules and rule groups to inspect and control web requests. If a Web ACL is empty, the web traffic passes without being detected or acted upon by the WAF. |
| SEC-5 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | vpc-network-acl-un used-check | This rule ensures that Amazon Virtual Private Cloud (VPC) network access control lists are in use. Monitoring for unused network access control lists can assist in accurate inventory and management of your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectivity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| SEC-5 | How do you protect your network resources? Any workload that has some form of network connectivity, whether it,Äö√Ñ√¥s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats. | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | rds-automatic-minor-version-upgrade-enabled | Enable automatic minor version upgrades on your Amazon Relational Database Service (RDS) instances to ensure the latest minor version updates to the Relational Database Management System (RDBMS) are installed , which may include security patches and bug fixes. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances, containers, AWS Lambda functions, database services, IoT devices, and more. | cloud-trail-log-file-validation-enabled | Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommend ed security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryptio n, log validation, and enabling AWS CloudTrail in multiple regions. |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | elastic-beanstalk-managed-updates-en abled | Enabling managed platform updates for an Amazon Elastic Beanstalk environme nt ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communica tion between a function and other services within the Amazon VPC. With this configuration, there is no requireme nt for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ecr-private-image-scanning-enabled | Amazon Elastic Container Repositor y (ECR) image scanning assists in identifying software vulnerabilities in your container images. Enabling image scanning on ECR repositories adds a layer of verification for the integrity and safety of the images being stored. |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ecs-container-insi ghts-enabled | Monitoring is an important part of maintaining the reliability, availabil ity, and performan ce of Amazon Elastic Container Service (ECS) and your AWS solutions. Container Insights also provides diagnostic informati on, such as container restart failures, to help you isolate issues and resolve them quickly. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ecs-fargate-latest-platform-version | Security updates and patches are deployed automatic ally for your AWS Fargate tasks. If a security issue is found that affects an AWS Fargate platform version, AWS patches the platform version. To assist in patch management of your Amazon Elastic Container Service (ECS) tasks running AWS Fargate, update your services standalone tasks to use the most recent platform version. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances, containers, AWS Lambda functions, database services, IoT devices, and more. | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-imdsv2-check | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-instance-multi ple-eni-check | This rule checks if your Amazon Elastic Compute Cloud (Amazon EC2) instances have multiple ENIs. Having multiple ENIs can cause dual-homed instances, meaning instances that have multiple subnets. This can add network security complexit y and introduce unintended network paths and access. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-instance-no-public-ip | Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts. |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-security-group-attached-to-eni-periodic | This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment. |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-stopped-instance | Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances , containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-volume-inuse-check | This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances, containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-6 | How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances, containers, AWS Lambda functions, database services, IoT devices, and more. | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | backup-recovery-point-encrypted | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | codebuild-project-artifact-encryption | To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild artifacts. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | codebuild-project-s3-logs-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your AWS CodeBuild logs stored in Amazon S3. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | cloud-trail-encryption-enabled | Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | elasticsearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service (OpenSearch Service) domains. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implement ing multiple controls, to reduce the risk of unauthorized access or mishandling. | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Managemen t Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implement ing multiple controls, to reduce the risk of unauthorized access or mishandling. | s3-bucket-server-s ide-encryption-ena bled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | secretsmanager-using-cmk | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implement ing multiple controls, to reduce the risk of unauthorized access or mishandling. | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implement ing multiple controls, to reduce the risk of unauthorized access or mishandling. | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implement ing multiple controls, to reduce the risk of unauthorized access or mishandling. | account-part-of-or ganizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsist ent account configura tions, which may expose resources and sensitive data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | s3-bucket-level-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access at the bucket level. |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-8 | How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling. | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | acm-certificate-expiration-check | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | elbv2-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | elb-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | alb-http-drop-invalid-header-enabled | Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | elasticsearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | opensearch-https-required | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | elb-tls-https-listeners-only | Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| SEC-9 | How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss. | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |

**Template**

The template is available on GitHub: Operational Best Practices for AWS Well-Architected Security Pillar.

## Operational Best Practices for BCP and DR

This conformance pack contains AWS Config rules based on BCP and DR within AWS. For a list of all managed rules supported by AWS Config, see List of AWS Config Managed Rules.

See the `Parameters` section in the following template for the names and descriptions of the required parameters.

The template is available on GitHub: Operational Best Practices for BCP and DR.

## Operational Best Practices for BNM RMiT

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Bank Negara Malaysia (BNM) Risk Management in Technology (RMiT) and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more BNM RMiT controls. A BNM RMiT control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.18 | A financial instituti on must conduct due diligence and evaluate the cryptographic controls associated with the technolog y used in order to protect the confident iality, integrity , authentication, authorisation and non -repudiation of information. Where a financial instituti on does not generate its own encryption keys, the financial institution shall | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Applicati on Load Balancer automatically redirects unencrypt ed HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| | undertake appropria te measures to ensure robust controls and processes are in place to manage encryption keys. Where this involves a reliance on third-party assessments, the financial instituti on shall consider whether such reliance is consistent with the financial instituti on's risk appetite and tolerance. A financial institution must also give due regard to the system resources required to support the cryptographic controls and the risk of reduced network traffic visibility of data that has been encrypted. | | |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.18 | A financial instituti on must conduct due diligence and evaluate the cryptographic controls associated with the technolog y used in order to protect the confident iality, integrity , authentication, authorisation and non -repudiation of information. Where a financial instituti on does not generate its own encryption keys, the financial institution shall undertake appropria te measures to ensure robust controls and processes are in place to manage encryption keys. Where this involves a reliance on third-party assessments, the financial instituti on shall consider whether such reliance is consistent with the financial instituti on's risk appetite and | api-gw-cache-enabl ed-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |

| 10.18 | A financial instituti on must conduct due diligence and evaluate the cryptographic controls associated with the technolog y used in order to protect the confident iality, integrity , authentication, authorisation and non -repudiation of information. Where a financial instituti on does not generate its own encryption keys, the financial institution shall undertake appropria te measures to ensure robust controls and processes are in place to manage encryption keys. Where this involves a reliance on third-party assessments, the financial instituti on shall consider whether such reliance is consistent with the financial instituti on's risk appetite and | secretsmanager-usi ng-cmk | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| | tolerance. A financial institution must also give due regard to the system resources required to support the cryptographic controls and the risk of reduced network traffic visibility of data that has been encrypted. | | |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.18 | A financial instituti on must conduct due diligence and evaluate the cryptographic controls associated with the technolog y used in order to protect the confident iality, integrity , authentication, authorisation and non -repudiation of information. Where a financial instituti on does not generate its own encryption keys, the financial institution shall undertake appropria te measures to ensure robust controls and processes are in place to manage encryption keys. Where this involves a reliance on third-party assessments, the financial instituti on shall consider whether such reliance is consistent with the financial instituti on's risk appetite and | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| | tolerance. A financial institution must also give due regard to the system resources required to support the cryptographic controls and the risk of reduced network traffic visibility of data that has been encrypted. | | |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.20 | A financial institution shall store public cryptographic keys in a certificate issued by a certificate authority as appropriate to the level of risk. Such certificates associated with customers shall be issued by recognised certificate authorities. The financial institution must ensure that the implementation of authentication and signature protocols using such certificates are subject to strong protection to ensure that the use of private cryptographic keys corresponding to the user certificates are legally binding and irrefutable. The initial issuance and subsequent renewal of such certificates must be consistent with industry best practices and applicable legal/regulatory specifications. | acm-certificate-expiration-check | Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.20 | A financial institution shall store public cryptographic keys in a certificate issued by a certificate authority as appropriate to the level of risk. Such certificates associated with customers shall be issued by recognised certificate authorities. The financial institution must ensure that the implementation of authentication and signature protocols using such certificates are subject to strong protection to ensure that the use of private cryptographic keys corresponding to the user certificates are legally binding and irrefutable. The initial issuance and subsequent renewal of such certificates must be consistent with industry best practices and applicable legal/regulatory specifications. | elbv2-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | beanstalk-enhanced-health-reporting-enabled | AWS Elastic Beanstalk enhanced health reporting enables a more rapid response to changes in the health of the underlying infrastructure. These changes could result in a lack of availability of the application. Elastic Beanstalk enhanced health reporting provides a status descriptor to gauge the severity of the identified issues and identify possible causes to investigate. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | dynamodb-throughput-limit-check | Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | ec2-instance-detailed-monitoring-enabled | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance. |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | lambda-concurrency-check | This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.27 | A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators. | rds-enhanced-monitoring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.34 | A financial institution must ensure the network services for its critical systems are reliable and have no SPOF in order to protect the critical systems against potential network faults and cyber threats. | elb-deletion-protection-enabled | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.34 | A financial institution must ensure the network services for its critical systems are reliable and have no SPOF in order to protect the critical systems against potential network faults and cyber threats. | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.35 | A financial institution must establish real-time network bandwidth monitoring processes and corresponding network service resilience metrics to flag any over utilisation of bandwidth and system disruptions due to bandwidth congestion and network faults. This includes traffic analysis to detect trends and anomalies. | api-gw-xray-enabled | AWS X-Ray collects data about requests that your application serves, and provides tools you can use to view, filter, and gain insights into that data to identify issues and opportunities for optimization. Ensure X-Ray is enables so you can see detailed information not only about the request and response, but also about calls that your application makes to downstream AWS resources, microservices, databases and HTTP web APIs. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.35 | A financial institution must establish real-time network bandwidth monitoring processes and corresponding network service resilience metrics to flag any over utilisation of bandwidth and system disruptions due to bandwidth congestion and network faults. This includes traffic analysis to detect trends and anomalies. | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |

| 10.35 | A financial institution must establish real-time network bandwidth monitoring processes and corresponding network service resilience metrics to flag any over utilisation of bandwidth and system disruptions due to bandwidth congestion and network faults. This includes traffic analysis to detect trends and anomalies. | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.35 | A financial institution must establish real-time network bandwidth monitoring processes and corresponding network service resilience metrics to flag any over utilisation of bandwidth and system disruptions due to bandwidth congestion and network faults. This includes traffic analysis to detect trends and anomalies. | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |
| 10.36 | A financial institution must ensure network services supporting critical systems are designed and implemented to ensure the confidentiality, integrity and availability of data. | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.36 | A financial institution must ensure network services supportin g critical systems are designed and implemented to ensure the confident iality, integrity and availability of data. | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configure d with SSL certifica tes to allow backend systems to authentic ate that requests originate from API Gateway. |
| 10.36 | A financial institution must ensure network services supportin g critical systems are designed and implemented to ensure the confident iality, integrity and availability of data. | elbv2-acm-certific ate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.36 | A financial institution must ensure network services supportin g critical systems are designed and implemented to ensure the confident iality, integrity and availability of data. | elb-deletion-prote ction-enabled | This rule ensures that Elastic Load Balancing has deletion protectio n enabled. Use this feature to prevent your load balancer from being accidenta lly or malicious ly deleted, which can lead to loss of availability for your applications. |
| 10.36 | A financial institution must ensure network services supportin g critical systems are designed and implemented to ensure the confident iality, integrity and availability of data. | nlb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your Network Load Balancers (NLBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.38 | A financial institution must ensure sufficient and relevant network device logs are retained for investigations and forensic purposes for at least three years. | cw-loggroup-retention-period-check | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | access-keys-rotated | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | autoscaling-launch-config-public-ip-disabled | If you configure your Network Interfaces with a public IP address, then the associated resources to those Network Interfaces are reachable from the internet. EC2 resources should not be publicly accessible, as this may allow unintended access to your applications or servers. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | backup-recovery-point-encrypted | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | cmk-backing-key-rotation-enabled | Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | ebs-snapshot-public-restorable-check | Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial instituti on must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthori sed disclosure and access. This shall include retaining ownership, control and management of all data pertainin g to customer and counterpa rty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |

| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial instituti on must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthori sed disclosure and access. This shall include retaining ownership, control and management of all data pertainin g to customer and counterpa rty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | internet-gateway-authorized-vpc-only | Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | kms-cmk-not-scheduled-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | lambda-function-public-access-prohibited | Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | lambda-inside-vpc | Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | no-unrestricted-route-to-igw | Ensure Amazon EC2 route tables do not have unrestricted routes to an internet gateway. Removing or limiting the access to the internet for workloads within Amazon VPCs can reduce unintended access within your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | opensearch-https-required | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | opensearch-in-vpc-only | Manage access to the AWS Cloud by ensuring Amazon OpenSearch Service domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon OpenSearch Service domain within an Amazon VPC enables secure communication between Amazon OpenSearch Service and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial instituti on must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthori sed disclosure and access. This shall include retaining ownership, control and management of all data pertainin g to customer and counterpa rty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | rds-instance-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | rds-snapshots-public-prohibited | Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | redshift-cluster-public-access-check | Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial instituti on must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthori sed disclosure and access. This shall include retaining ownership, control and management of all data pertainin g to customer and counterpa rty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | redshift-enhanced-vpc-routing-enabled | Enhanced VPC routing forces all COPY and UNLOAD traffic between the cluster and data repositories to go through your Amazon VPC. You can then use VPC features such as security groups and network access control lists to secure network traffic. You can also use VPC flow logs to monitor network traffic. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | root-account-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | s3-account-level-public-access-blocks-periodic | Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | s3-bucket-public-read-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | s3-bucket-public-write-prohibited | Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | sagemaker-notebook-no-direct-internet-access | Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial instituti on must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthori sed disclosure and access. This shall include retaining ownership, control and management of all data pertainin g to customer and counterpa rty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | ssm-document-not-public | Ensure AWS Systems Manager (SSM) documents are not public, as this may allow unintended access to your SSM documents. A public SSM document can expose information about your account, resources and internal processes. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.51 | A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management. | subnet-auto-assign-public-ip-disabled | Manage access to the AWS Cloud by ensuring Amazon Virtual Private Cloud (VPC) subnets are not automatically assigned a public IP address. Amazon Elastic Compute Cloud (EC2) instances that are launched into subnets that have this attribute enabled have a public IP address assigned to their primary network interface. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial instituti on must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | access-keys-rotated | The credentials are audited for authorize d devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromis ed. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative |

| --- | --- | --- | --- |
| | | | information about each principal. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatterns parameter. (AWS Foundational Security Best Practices value: kms:Decrypt, kms:ReEncryptFrom). The actual values should reflect your organization's policies |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial instituti on must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | iam-no-inline-policy-check | Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommend s to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissio ns management. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial instituti on must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| | | | sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial instituti on must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | iam-user-group-membership-check | AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | iam-user-no-policies-check | This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems. | iam-user-unused-credentials-check | AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.52 | A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third-party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| --- | --- | --- | --- |
| 10.53(b)(h)(i) | In observing paragraph 10.52, a financial institution should consider the following principles in its access control policy: (b) employ "least privilege" access rights or on a 'need-to-have' basis where only the minimum sufficien t permissions are granted to legitimat e users to perform their roles; (h) limit and control the sharing of user ID and passwords across multiple users; and (i) control the use of generic user ID naming conventio ns in favour of more personally identifia ble IDs. | iam-root-access-key-check | Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Managemen t (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.53(b) | In observing paragraph 10.52, a financial institution should consider the following principles in its access control policy: (b) employ "least privilege" access rights or on a 'need-to-have' basis where only the minimum sufficien t permissions are granted to legitimat e users to perform their roles; | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.53(b) | In observing paragraph 10.52, a financial institution should consider the following principles in its access control policy: (b) employ "least privilege" access rights or on a 'need-to-have' basis where only the minimum sufficien t permissions are granted to legitimat e users to perform their roles; | emr-kerberos-enabl ed | The access permissio ns and authoriza tions can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribut ion center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative |

| --- | --- | --- | --- |
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | access-keys-rotated | The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as specified by the organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | account-part-of-organizations | Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data. |
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | cw-loggroup-retention-period-check | Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | ec2-instance-profile-attached | EC2 instance profiles pass an IAM role to an EC2 instance. Attaching an instance profile to your instances can assist with least privilege and permissions management. |

| --- | --- | --- | --- |
| 10.59 | A financial institution must ensure (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner. | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.60 | In fulfilling the requirement under paragraph 10.59, large financial institutions are required to (a) deploy an identity access management system to effectively manage and monitor user access to enterpris e-wide systems; and (b) deploy automated audit tools to flag any anomalies. | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |
| 10.60 | In fulfilling the requirement under paragraph 10.61, large financial institutions are required to (a) deploy an identity access management system to effectively manage and monitor user access to enterpris e-wide systems; and (b) deploy automated audit tools to flag any anomalies. | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.60 | In fulfilling the requirement under paragraph 10.61, large financial institutions are required to (a) deploy an identity access management system to effectively manage and monitor user access to enterpris e-wide systems; and (b) deploy automated audit tools to flag any anomalies. | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connectio ns, devices, and software. AWS Security Hub aggregates, organizes , and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.61 | A financial institution must ensure that critical systems are not running on outdated systems with known security vulnerabilities or end-of-life (EOL) technology systems. In this regard, a financial institution must clearly assign responsibilities to identified functions: (a) to continuously monitor and implement latest patch releases in a timely manner; and (b) identify critical technology systems that are approaching EOL for further remedial action. | ec2-instance-managed-by-systems-manager | An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.61 | A financial institution must ensure that critical systems are not running on outdated systems with known security vulnerabilities or end-of-life (EOL) technology systems. In this regard, a financial institution must clearly assign responsibilities to identified functions: (a) to continuously monitor and implement latest patch releases in a timely manner; and (b) identify critical technology systems that are approaching EOL for further remedial action. | ec2-managedinstance-association-compliance-status-check | Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.61 | A financial institution must ensure that critical systems are not running on outdated systems with known security vulnerabilities or end-of-life (EOL) technology systems. In this regard, a financial institution must clearly assign responsibilities to identified functions: (a) to continuously monitor and implement latest patch releases in a timely manner; and (b) identify critical technology systems that are approaching EOL for further remedial action. | ec2-managedinstance-patch-compliance-status-check | Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.61 | A financial institution must ensure that critical systems are not running on outdated systems with known security vulnerabilities or end-of-life (EOL) technology systems. In this regard, a financial institution must clearly assign responsibilities to identified functions: (a) to continuously monitor and implement latest patch releases in a timely manner; and (b) identify critical technology systems that are approaching EOL for further remedial action. | elastic-beanstalk-managed-updates-enabled | Enabling managed platform updates for an Amazon Elastic Beanstalk environment ensures that the latest available platform fixes, updates, and features for the environment are installed. Keeping up to date with patch installation is a best practice in securing systems. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.61 | A financial institution must ensure that critical systems are not running on outdated systems with known security vulnerabilities or end-of-life (EOL) technology systems. In this regard, a financial institution must clearly assign responsibilities to identified functions: (a) to continuously monitor and implement latest patch releases in a timely manner; and (b) identify critical technology systems that are approaching EOL for further remedial action. | redshift-cluster-maintenancesettings-check | This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferred MaintenanceWindow (the default is sat:16:00-sat:16:30), and the automated SnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | backup-recovery-point-encrypted | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | elbv2-acm-certificate-required | Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial instituti on must implement robust technolog y security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |
| 10.64(a) | A financial instituti on must implement robust technolog y security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | opensearch-encrypt ed-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryptio n is enabled for your Amazon OpenSearch Service domains. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | opensearch-https-required | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | rds-storage-encrypted | To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | s3-bucket-server-side-encryption-enabled | To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | sagemaker-endpoint-configuration-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | sagemaker-notebook-instance-kms-key-configured | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | secretsmanager-using-cmk | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data. |
| 10.64(a) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(b) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered from channels and devices with minimum disruption to services | dynamodb-autoscaling-enabled | Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling. |
| 10.64(b) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered from channels and devices with minimum disruption to services | ec2-stopped-instance | Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| 10.64(b) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered from channels and devices with minimum disruption to services | elb-deletion-protection-enabled | This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |
| 10.64(b) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered from channels and devices with minimum disruption to services | nlb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your NetworkLoad Balancers (NLBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(b) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered from channels and devices with minimum disruption to services | rds-instance-deletion-protection-enabled | Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(b) | A financial instituti on must implement robust technolog y security controls in providing digital services which assure the following: (b) reliability of services delivered from channels and devices with minimum disruption to services | rds-multi-az-support | Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(b) | A financial instituti on must implement robust technolog y security controls in providing digital services which assure the following: (b) reliability of services delivered from channels and devices with minimum disruption to services | rds-cluster-multi-az-enabled | Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(b) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered from channels and devices with minimum disruption to services | vpc-vpn-2-tunnels-up | Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | api-gw-execution-logging-enabled | API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities. |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | autoscaling-group-elb-healthcheck-required | The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | cloudtrail-s3-dataevents-enabled | The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event. |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | cloudwatch-alarm-action-check | Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | dynamodb-throughput-limit-check | Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set accountRCUThresholdPercentage (Config Default: 80) and accountWCUThresholdPercentage (Config Default: 80) parameters. The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | ec2-instance-detailed-monitoring-enabled | Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance. |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | elb-logging-enabled | Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | opensearch-logs-to-cloudwatch | Ensure Amazon OpenSearch Service domains have error logs enabled and streamed to Amazon CloudWatch Logs for retention and response. OpenSearch Service error logs can assist with security and access audits, and can help to diagnose availability issues. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | rds-enhanced-monitoring-enabled | Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | rds-logging-enabled | To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | redshift-cluster-configuration-check | To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | s3-bucket-logging-enabled | Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(d) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions | wafv2-logging-enabled | To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | aurora-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Aurora resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | db-instance-backup-enabled | The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements. |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | dynamodb-pitr-enabled | Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial instituti on must implement robust technolog y security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | dynamodb-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon DynamoDB resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifie s your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | ebs-optimized-instance | An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | ebs-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | ec2-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Elastic Compute Cloud (Amazon EC2) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | efs-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial instituti on must implement robust technolog y security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | elasticache-redis-cluster-automatic-backup-check | When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | rds-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) resources are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | redshift-backup-enabled | To help with data back-up processes, ensure your Amazon Redshift clusters have automated snapshots. When automated snapshots are enabled for a cluster, Redshift periodically takes snapshots of that cluster. By default, Redshift takes a snapshot every eight hours or every 5 GB for each node of data changes, or whichever comes first. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial instituti on must implement robust technolog y security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | s3-bucket-versioning-enabled | Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and applicati on failures. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| 10.64(e) | A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption | s3-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Simple Storage Service (S3) buckets are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

Use automated tools to review and monitor changes to configuration and rules settings. | securityhub-enabled | AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| Appendix 5.5(b) | Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| Appendix 5.5(b) | Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configured with SSL certificates to allow backend systems to authenticate that requests originate from API Gateway. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 5.5(b) | Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec | opensearch-https-required | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. |
| Appendix 5.5(b) | Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec | opensearch-node-to-node-encryption-check | Ensure node-to-node encryption for Amazon OpenSearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| Appendix 5.5(b) | Ensure security controls for server-to-server external network connectio ns include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec | redshift-require-tls-ssl | Ensure that your Amazon Redshift clusters require TLS/SSL encryptio n to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data. |
| Appendix 5.5(b) | Ensure security controls for server-to-server external network connectio ns include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec | s3-bucket-ssl-requ ests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 5.5(c) | Ensure security controls for server-to-server external network connections include the following : (c) deploying staging servers with adequate perimeter defences and protection such as firewall, IPS and antivirus. | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment. |
| Appendix 5.5(c) | Ensure security controls for server-to-server external network connections include the following : (c) deploying staging servers with adequate perimeter defences and protection such as firewall, IPS and antivirus. | vpc-default-security-group-closed | Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricti ng all the traffic on the default security group helps in restricting remote access to your AWS resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 5.5(c) | Ensure security controls for server-to-server external network connections include the following : (c) deploying staging servers with adequate perimeter defences and protection such as firewall, IPS and antivirus. | vpc-sg-open-only-to-authorized-ports | Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 5.6 | Ensure security controls for remote access to server include the following : (a) restrict access to only hardened and locked down end-point devices; (b) use secure tunnels such as TLS and VPN IPSec; (c) deploy 'gateway' server with adequate perimeter defences and protection such as firewall, IPS and antivirus; and (d) close relevant ports immediately upon expiry of remote access. | alb-http-to-https-redirection-check | To help protect data in transit, ensure that your Applicati on Load Balancer automatically redirects unencrypt ed HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
|---|---|---|---|
| Appendix 5.6 | Ensure security controls for remote access to server include the following : (a) restrict access to only hardened and locked down end-point devices; (b) use secure tunnels such as TLS and VPN IPSec; (c) deploy 'gateway' server with adequate perimeter defences and protection such as firewall, IPS and antivirus; and (d) close relevant ports immediately upon expiry of remote access. | api-gw-ssl-enabled | Ensure Amazon API Gateway REST API stages are configure d with SSL certifica tes to allow backend systems to authentic ate that requests originate from API Gateway. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 5.6 | Ensure security controls for remote access to server include the following : (a) restrict access to only hardened and locked down end-point devices; (b) use secure tunnels such as TLS and VPN IPSec; (c) deploy 'gateway' server with adequate perimeter defences and protection such as firewall, IPS and antivirus; and (d) close relevant ports immediately upon expiry of remote access. | opensearch-https-required | Because sensitive data can exist and to help protect data in transit, ensure HTTPS is enabled for connections to your Amazon OpenSearch Service domains. |

| Appendix 10 Part B - 1 (c) | A financial institution should use the latest network architecture approach and appropriate network design concept and solutions for managing and monitoring granular network security and centralized network provision in managing complexity of the cloud network environment. | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment. |
| Appendix 10 Part B - 1 (c) | A financial institution should use the latest network architecture approach and appropriate network design concept and solutions for managing and monitoring granular network security and centralized network provision in managing complexity of the cloud network environment. | vpc-flow-logs-enabled | The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 1 (d) | A financial institution should establish and utilise secure and encrypted communication channels for migrating physical servers, applications, or data to the cloud platforms. | dms-replication-not-public | Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts. |
| Appendix 10 Part B - 1 (d) | A financial institution should establish and utilise secure and encrypted communication channels for migrating physical servers, applications, or data to the cloud platforms. | s3-bucket-ssl-requests-only | To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 1 (f) i) | The increasing use of applicati on programming interfaces (API) by financial instituti on to interconn ect with external application service providers could achieve efficiency in new service delivery. However, this may increase the cyber-attack surface and any mismanage ment may amplify the impact of an information security incident. A financial institution should ensure its APIs are subject to rigorous management and control mechanism s which include the following: i) APIs should be designed for service resilienc e to avoid the risk of single points of failure and configure d securely with appropriate access controls; | api-gwv2-authoriza tion-type-configured | Ensure your Amazon API Gateway v2 API route has an authorization type set to prevent unauthorized access to the underlying backend resources. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 1 (f) ii) | The increasing use of applicati on programming interfaces (API) by financial instituti on to interconn ect with external application service providers could achieve efficiency in new service delivery. However, this may increase the cyber-attack surface and any mismanage ment may amplify the impact of an information security incident. A financial institution should ensure its APIs are subject to rigorous management and control mechanism s which include the following: ii) APIs should be tracked and monitored against cyber-att acks with adequate incident response measures and are de-commissioned on a | api-gw-associated-with-waf | AWS WAF enables you to configure a set of rules (called a web access control list (web ACL)) that allow, block, or count web requests based on customizable web security rules and conditions that you define. Ensure your Amazon API Gateway stage is associated with a WAF Web ACL to protect it from malicious attacks |

|---|---|---|---|
| Appendix 10 Part B - 5 (a) i) | As part of an effective recovery capability, financial institutions should ensure existing backup and recovery procedures are extended to cover cloud services, which includes the following: i) define and formalise backup and recovery strategy at the planning stage of cloud adoption; | s3-resources-protected-by-backup-plan | To help with data back-up processes, ensure your Amazon Simple Storage Service (S3) buckets are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 5 (b) | A financial institution should ensure backup and restoration procedures are periodically tested to validate recovery capabilities. The frequency of backup procedures should be commensurate with the criticality of the system and recovery point objective (RPO) of the system. Remedial actions should be taken promptly by the financial institution for unsuccessful backups. | backup-plan-min-frequency-and-min-retention-check | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 5 (c) i) | A financial institution should ensure sufficient backup and recovery of virtual machine and container including backup configuration settings (for IaaS and PaaS, where relevant), which includes the following: i) ensure the capability to restore a virtual machine and container at point-in-time as specified by the the business recovery objectives; | backup-plan-min-frequency-and-min-retention-check | To help with data back-up processes, ensure your AWS Backup plan is set for a minimum frequency and retention. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements. This rule allows you to set the requiredFrequencyValue (Config default: 1), requiredRetentionDays (Config default: 35) and requiredFrequencyUnit (Config default: days) parameters. The actual value should reflect your organizations requirements. |

| Control ID | Control Description | AWS Config Rule | Guidance |

| Appendix 10 Part B - 5 (d) i) | A financial instituti on should assess the resilience requireme nts of the cloud services and identify appropriate measures that commensurate with the criticality of the system, to ensure service availabil ity in the extreme adverse scenarios . Financial instituti ons should consider a risk-based approach and progressively adopt appropriate mitigating controls to ensure service availability and mitigate concentra tion risk. Amongst the viable options are: i) leverage cloud services' high availability and redundancy features to ensure productio n data centres have redundant capacity in different availability zones; | autoscaling-multiple-az | To ensure high availability, ensure your Auto Scaling group is configure d to span multiple Availability Zones. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 5 (d) i) | A financial instituti on should assess the resilience requireme nts of the cloud services and identify appropriate measures that commensurate with the criticality of the system, to ensure service availabil ity in the extreme adverse scenarios . Financial instituti ons should consider a risk-based approach and progressively adopt appropriate mitigating controls to ensure service availability and mitigate concentra tion risk. Amongst the viable options are: i) leverage cloud services' high availability and redundancy features to ensure productio n data centres have redundant capacity in different availability zones; | elbv2-multiple-az | Elastic Load Balancing (ELB) automatically distributes your incoming traffic across multiple targets, such as EC2 instances, container s, and IP addresses , in an availability zone. To ensure high availability, ensure your ELB has registered instances from multiple Availability Zones. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 5 (d) i) | A financial instituti on should assess the resilience requireme nts of the cloud services and identify appropriate measures that commensurate with the criticality of the system, to ensure service availabil ity in the extreme adverse scenarios . Financial instituti ons should consider a risk-based approach and progressively adopt appropriate mitigating controls to ensure service availability and mitigate concentra tion risk. Amongst the viable options are: i) leverage cloud services' high availability and redundancy features to ensure productio n data centres have redundant capacity in different availability zones; | lambda-vpc-multi-az-check | If your AWS Lambda function is configure d to connect to a virtual private cloud (VPC) in your account, deploy the AWS Lambda function in at least two different Availability Zones to ensure that it is your function is available to process events in case of a service interruption in a single zone. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 5 (d) i) | A financial instituti on should assess the resilience requireme nts of the cloud services and identify appropriate measures that commensurate with the criticality of the system, to ensure service availabil ity in the extreme adverse scenarios . Financial instituti ons should consider a risk-based approach and progressively adopt appropriate mitigating controls to ensure service availability and mitigate concentra tion risk. Amongst the viable options are: i) leverage cloud services' high availability and redundancy features to ensure productio n data centres have redundant capacity in different availability zones; | nlb-cross-zone-load-balancing-enabled | Enable cross-zone load balancing for your NetworkLoad Balancers (NLBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 5 (d) i) | A financial institution should assess the resilience requirements of the cloud services and identify appropriate measures that commensurate with the criticality of the system, to ensure service availability in the extreme adverse scenarios. Financial institutions should consider a risk-based approach and progressively adopt appropriate mitigating controls to ensure service availability and mitigate concentration risk. Amongst the viable options are: i) leverage cloud services' high availability and redundancy features to ensure production data centres have redundant capacity in different availability zones; | rds-cluster-multi-az-enabled | Amazon Relational Database Service (Amazon RDS) clusters should have Multi-AZ replication enabled to assist in the availability of the data that is stored. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 5 (d) i) | A financial instituti on should assess the resilience requireme nts of the cloud services and identify appropriate measures that commensurate with the criticality of the system, to ensure service availabil ity in the extreme adverse scenarios . Financial instituti ons should consider a risk-based approach and progressively adopt appropriate mitigating controls to ensure service availability and mitigate concentra tion risk. Amongst the viable options are: i) leverage cloud services' high availability and redundancy features to ensure productio n data centres have redundant capacity in different availability zones; | rds-multi-az-support | Multi-AZ support in Amazon Relationa l Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availabil ity Zone. Each Availability Zone runs on its own physicall y distinct, independe nt infrastructure, and is engineered to be highly reliable. In case of an infrastru cture failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operation s as soon as the failover is complete. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | api-gw-cache-enabled-and-encrypted | To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data. |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | backup-recovery-point-encrypted | Ensure that encryption is enabled for your AWS Backup recovery points. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions. |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | cloudwatch-log-group-encrypted | To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | dynamodb-table-encrypted-kms | Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK). |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | ec2-ebs-encryption-by-default | To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | efs-encrypted-check | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS). |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | eks-secrets-encrypted | To help protect data at rest, ensure that your Amazon Elastic Kubernetes Service (EKS) clusters are configured to have Kubernetes secrets encrypted. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data. |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | encrypted-volumes | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | opensearch-encrypted-at-rest | Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon OpenSearch Service domains. |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | rds-snapshot-encrypted | Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | redshift-cluster-kms-enabled | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your Amazon Redshift cluster. Because sensitive data can exist at rest in Redshift clusters, enable encryption at rest to help protect that data. |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | s3-default-encryption-kms | Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | secretsmanager-using-cmk | To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for AWS Secrets Manager secrets. Because sensitive data can exist at rest in Secrets Manager secrets, enable encryption at rest to help protect that data. |
| Appendix 10 Part B - 8 (a) | A financial institution should implement appropriate and relevant encryption techniques to protect the confidentiality and integrity of sensitive data stored on the cloud. | sns-encrypted-kms | To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (d) | As the usage of cloud adoption increases , managing many encryption keys used for protectin g data has become more complex and may introduce new challenges for financial institutions. A financial instituti on should adopt a comprehensive and centralized approach to key managemen t including the use of centralised key management system that can handle generations, storage and distribution of keys in a secure and scalable manner. | cmk-backing-key-ro tation-enabled | Enable key rotation to ensure that keys are rotated after they have reached the end of their crypto period. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 8 (d) | As the usage of cloud adoption increases , managing many encryption keys used for protectin g data has become more complex and may introduce new challenges for financial institutions. A financial instituti on should adopt a comprehensive and centralized approach to key managemen t including the use of centralised key management system that can handle generations, storage and distribution of keys in a secure and scalable manner. | kms-cmk-not-schedu led-for-deletion | To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 9 (a) ii) | The management plane is a key security difference between traditional infrastru cture and cloud computing where remote access is supported by default. This access layer could be prone to cyber-attacks thereby compromising the integrity of the entire cloud deploymen t. In view of this, financial Instituti ons should ensure the use of strong controls for accessing the management plane which may include the following : ii) implement "least privilege" and strong multi-factor authentication (MFA) for example, strong password, soft token, privileged access management tool and maker-checker functions; | iam-password-policy | The identities and the credentials are issued, managed, and verified based on an organizat ional IAM password policy. They meet or exceed requireme nts as stated by NIST SP 800-63 and the AWS Foundatio nal Security Best Practices standard for password strength. This rule allows you to optionally set RequireUppercaseCh aracters (AWS Foundational Security Best Practices value: true), RequireLo wercaseCharacters (AWS Foundatio nal Security Best Practices value: true), RequireSymbols (AWS Foundatio nal Security Best Practices value: true), RequireNumbers (AWS Foundatio nal Security Best Practices value: true), MinimumPa |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| | | | sswordLength (AWS Foundational Security Best Practices value: 14), PasswordR eusePrevention (AWS Foundatio nal Security Best Practices value: 24), and MaxPasswordAge (AWS Foundatio nal Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organizat ion's policies. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 9 (a) ii) | The management plane is a key security difference between traditional infrastructure and cloud computing where remote access is supported by default. This access layer could be prone to cyber-attacks thereby compromising the integrity of the entire cloud deployment. In view of this, financial Institutions should ensure the use of strong controls for accessing the management plane which may include the following: ii) implement "least privilege" and strong multi-factor authentication (MFA) for example, strong password, soft token, privileged access management tool and maker-checker functions; | iam-user-mfa-enabled | Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 9 (a) ii) | The management plane is a key security difference between traditional infrastructure and cloud computing where remote access is supported by default. This access layer could be prone to cyber-attacks thereby compromising the integrity of the entire cloud deployment. In view of this, financial Institutions should ensure the use of strong controls for accessing the management plane which may include the following: ii) implement "least privilege" and strong multi-factor authentication (MFA) for example, strong password, soft token, privileged access management tool and maker-checker functions; | root-account-hardware-mfa-enabled | Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 9 (a) ii) | The management plane is a key security difference between traditional infrastru cture and cloud computing where remote access is supported by default. This access layer could be prone to cyber-attacks thereby compromising the integrity of the entire cloud deploymen t. In view of this, financial Instituti ons should ensure the use of strong controls for accessing the management plane which may include the following : ii) implement "least privilege" and strong multi-factor authentication (MFA) for example, strong password, soft token, privileged access management tool and maker-checker functions; | root-account-mfa-e nabled | Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protectio n for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 9 (a) iii) | The management plane is a key security difference between traditional infrastructure and cloud computing where remote access is supported by default. This access layer could be prone to cyber-attacks thereby compromising the integrity of the entire cloud deployment. In view of this, financial Institutions should ensure the use of strong controls for accessing the management plane which may include the following: iii) employ granular entitlement allocation for privileged users; | iam-policy-no-statements-with-admin-access | AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 9 (a) iii) | The management plane is a key security difference between traditional infrastru cture and cloud computing where remote access is supported by default. This access layer could be prone to cyber-attacks thereby compromising the integrity of the entire cloud deploymen t. In view of this, financial Instituti ons should ensure the use of strong controls for accessing the management plane which may include the following : iii) employ granular entitlement allocatio n for privileged users; | iam-user-no-policies-check | This rule ensures AWS Identity and Access Managemen t (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportuni ty for an identity to receive or retain excessive privileges. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 9 (a) iv) | The management plane is a key security difference between traditional infrastru cture and cloud computing where remote access is supported by default. This access layer could be prone to cyber-attacks thereby compromising the integrity of the entire cloud deploymen t. In view of this, financial Institutions should ensure the use of strong controls for accessing the management plane which may include the following: iv) conduct continuou s monitoring of the activities performed by privileged users; | cloudtrail-security-trail-enabled | This rule helps ensure the use of AWS recommend ed security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryptio n, log validation, and enabling AWS CloudTrail in multiple regions. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 9 (a) iv) | The management plane is a key security difference between traditional infrastru cture and cloud computing where remote access is supported by default. This access layer could be prone to cyber-attacks thereby compromising the integrity of the entire cloud deploymen t. In view of this, financial Institutions should ensure the use of strong controls for accessing the management plane which may include the following: iv) conduct continuou s monitoring of the activities performed by privileged users; | cloud-trail-cloud-watch-logs-enabled | Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 12 (a) | A financial instituti on should protect the data hosted in cloud services as required under the Data Loss Prevention section (paragraphs 11.14 to 11.16) of this policy document, including the expansion of the endpoint footprint if the financial instituti on allows its staff to use their own devices to access the sensitive data. | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment. |
| Appendix 10 Part B - 12 (a) | A financial instituti on should protect the data hosted in cloud services as required under the Data Loss Prevention section (paragraphs 11.14 to 11.16) of this policy document, including the expansion of the endpoint footprint if the financial instituti on allows its staff to use their own devices to access the sensitive data. | macie-status-check | Amazon Macie is a data security service that uses machine learning (ML) and pattern matching to discover and help protect your sensitive data stored in Amazon Simple Storage Service (S3) buckets. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 14 (c) i) | A financial instituti on should consider the following additional measures in the developme nt of its CIRP: i) enhance its ability to detect security breach incidents to achieve effective incident managemen t, including the ability to detect data leakage on the dark web; | guardduty-enabled-centralized | Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpecte d, unauthorized, and malicious activity within your AWS Cloud environment. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| Appendix 10 Part B - 14 (c) i) | A financial institution should consider the following additional measures in the development of its CIRP: i) enhance its ability to detect security breach incidents to achieve effective incident management, including the ability to detect data leakage on the dark web; | guardduty-non-archived-findings | Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies. |

### Template

The template is available on GitHub: Operational Best Practices for BNM RMiT.

## Operational Best Practices for Canadian Centre for Cyber Security (CCCS) Medium Cloud Control Profile

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Canadian Centre for Cyber Security (CCCS) Medium Cloud Control Profile and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more CCCS Medium Cloud Control Profile controls. A CCCS Medium Cloud Control Profile control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| CCCS-fPBMM-AC-2(1) | AC-2(1) Account Management \| Automated System Account Management | cloudtrail-enabled | AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| CCCS-fPBMM-AC-2(1) | AC-2(1) Account Management \| Automated System Account Management | ec2-imdsv2-check | Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-b ased controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata. |
| CCCS-fPBMM-AC-2(1) | AC-2(1) Account Management \| Automated System Account Management | ecs-task-definition-user-for-host-mode-check | If a task definition has elevated privilege s it is because the customer has specifically opted-in to those configura tions. This control checks for unexpecte d privilege escalation when a task definitio n has host networkin g enabled but the customer has not opted-in to elevated privileges. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| CCCS-fPBMM-AC-2(1) | AC-2(1) Account Management \| Automated System Account Management | emr-kerberos-enabled | The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative |

| | | | information about each principal. |

| Control ID | Control Description | AWS Config Rule | Guidance |
| --- | --- | --- | --- |
| CCCS-fPBMM-AC-2(1) | AC-2(1) Account Management \| Automated System Account Management | iam-customer-policy-blocked-kms-actions | AWS Identity and Access Managemen t (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissio ns and authoriza tions, restricti ng policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the blockedActionsPatt erns parameter. (AWS Foundational Security Best Practices value: kms:Decry pt, kms:ReEnc ryptFrom). The actual values should reflect your organization's policies |
